BELLE VUE SPA

TREFRIW, NORTH WALES.

(Railway Station: Llanrwst and Trefriw.)

COMBINED TREATMENT OF ARTHRITIS

By Chalybeate Waters, Tonic Baths and Extension Appliances.

The Belle Vue Spa Hotel provides accommodation for patients for whom these tonic chalybeate waters are indicated. External treatment by tonic baths, as well as by manipulation and extension and light, is also provided.

Recent analyses of the Belle Vue Spa waters show that they are exceptionally rich in ferrous salts. Samples have been repeatedly examined by the Clinical Research Association.

A new building furnished with Baths and all modern Electrical Appliances for treatment was opened on Saturday, April 26th.

Under expert advice the drinking service of the Belle Vue Spa water is now taken from selected sources in the water-yielding rock, and served fresh at the Spa at a standard strength of 1 grain of ferrous sulphate in one ounce.

For patients who are unable to visit Trefriw and take the water on the spot, it is bottled and exported at the same standard strength for medical use in their own homes.

In suitable cases of arthritis and rheumatic disease Hoefftcke's manipulative and ambulatory extension treatment can be applied.

Mobility and freedom from pain in crippling arthritis of the hip and knee can often be obtained, even after shortening and contraction have occurred. This is effected by the extension appliances, which maintain continuous extension by day and by night. The appliance usually permits the patient to walk, and not only supports the weight but replaces the undesirable state of compression of the leg by one of active stretching.

This method secures:—

(1) Extension without muscle loss, inevitable whilst the patient is kept in bed
(2) Extension without vascular stasis, which occurs when a joint is kept at rest.
(3) MOVEMENT WITHOUT PAIN.

The result has been a restoration of joint function in many cases which had been regarded as hopeless and incurable. The Spa is under medical supervision and close co-operation is maintained with the patient's own physician.

Further particulars may be obtained at Belle Vue Spa or 7, Harley Street, W.1.

EDUCATIONAL NUMBER. SESSION 1930-31.

A REVIEW OF THE MEDICAL CURRICULUM.

BY

H. R. DEAN, M.D., F.R.C.P.,

PROFESSOR OF PHYSIOLOGY, UNIVERSITY OF CAMBRIDGE.

THE most difficult problem in the medical curriculum is the result of the growth in the medical sciences which has taken place during the thirty years of this century, for the medical student of 1930 is required to know much more than his predecessor of 1900. Physics and chemistry have expanded as a result of a series of progressive revolutions, and physiology has increased its territory. Relatively new branches of medical science, biochemistry and pathology, have so grown and developed that they claim a share of the student's time equal to that allotted to the older branches of biology, and psychology demands admission to the league of medical sciences.

During the clinical period the student's difficulties have been greatly increased by the progressive and inevitable tendency to specialization. New and highly technical methods of diagnosis have been devised, utilizing the rays, the electrocardiograph, and applications of chemical and bacteriological methods. New forms of treatment have come into being, based on radium, different types of light, and systems of remedial gymnastics. New departments for the treatment of single diseases such as tuberculosis, or groups such as the venereal diseases, have appeared. The older-established special departments have intensified their demands on the student's attention. The time allotted to clerking and dressing may not be curtailed, but there are limits to the capacity of the human mind, and the student may easily be distracted from the study of general medicine and general surgery by the diversity of the technical methods of diagnosis and treatment which have been elaborated in the special departments. Preparation for the Final Examination has not been made easier by the regulations of those qualifying bodies which require certificates of attendance at courses of instruction given in special departments.

The minimum period of study required by the General Medical Council is five years, although it was common knowledge before the war that at least six years were needed to obtain the medical degree of several English universities. In the last decade of the nineteenth century the student spent his first year in the acquirement of an elementary knowledge of chemistry, physics, and biology, the next two years in the departments of physiology and anatomy, and his last two years in the wards. But before the close of the century many intending medical students began the study of chemistry and physics at school. During the ten years which preceded the war the medical curriculum became more and more congested, and when the war ended it was obvious to everybody that something ought to be done. The General Medical Council reviewed the curriculum. In the presence of deans of medical faculties, of professors, and of other duly appointed representatives of the universities and medical schools of Great Britain and Ireland the five years "box" of the medical curriculum was opened, and its contents were examined. Within were found the numerous parts of the curriculum cut and shaped and arranged like the pieces of a Chinese puzzle so that they exactly fitted the box. The pieces were taken out, and each piece was handed to an appropriate committee to be reshaped, but, when the time came to reassemble the pieces of the puzzle, it was found that most of the pieces had got much larger, and all the pieces could not be got into the box.

The clinicians pointed out that of the minimum period of five years three had in the past been devoted to laboratory work and only two to work in the hospital: a minimum period of three years' clinical study subsequent to the examinations in anatomy and physiology was ordained. The two years allotted to anatomy and physiology could not be curtailed, what was to be done with chemistry and biology? It was clear that the period of medical study must be extended. On financial grounds an extension of the minimum period of medical study seemed inadvisable or inopportune, so it was camouflaged and remained five years, but no boy was to be allowed to become a student until he had passed an examination in chemistry and physics. The first stage of the medical curriculum was relegated to the public and secondary schools. The change in this direction had begun, of course, long before the war, and many universities had permitted or encouraged intending students to prepare at school for the First M.B. Examination. But the General Medical Council made a distinct and far-reaching step when it required an examination in chemistry and physics as a preliminary condition to registration as a medical student.

To-day the work necessary for a medical degree or qualification falls into three periods or stages.

1. A period of about two years at a public or secondary school devoted to the study of chemistry, physics, and often biology.
2. A period of two years in the dissecting room and laboratories of a university or medical school.
3. A period of three years of clinical study in a hospital.

If allowance is made for failure at examinations or illness, the average period of study may be nearer eight than seven years, but these years spent to the best possible advantage

The School Period

The General Medical Council does not enforce the registration of medical students, and each university or qualifying body is free to make its own regulations for the study of elementary chemistry, physics, and biology. It may include these subjects within its own curriculum, or may permit or require candidates to pass examinations in these subjects before admission to the medical school. But unless the student has completed the prescribed courses in elementary chemistry, physics, and biology at the greater part of

After the examinations in elementary science the student begins anatomy and physiology. The transition from the general biology of the zoology department to the stern realities of the dissecting room is abrupt and often unmitigated; there is room for correlation here. But the thing which every medical man remembers about anatomy is the number of hours which must be spent in the dissecting room, and the number of hours which must be spent before the required details can be committed to memory. To many, if not to all of us, who are not professional anatomists, it seems that the student is required to master details, some of which are essential neither to the concurrent study of physiology nor the subsequent comprehension of medicine and surgery. Certainly much of the anatomy which the student knows at the time of his examination is forgotten within the next three years, and much of that which is forgotten is never missed.

Anatomy is not, of course, the only subject which fades from the memory when the examination is passed, and it may be necessary to learn a great deal of anatomy in order that some may remain in the memory. But after a conference of anatomists with teachers of other subjects it might be possible to reduce the time spent on dissection, and on the acquirement of a knowledge of topographical anatomy. For the technical methods involved in the dissection of the various parts are essentially the same, and the mental processes involved are those which depend on a visual memory. After one or two parts have been dissected, further dissection brings no new experience to brain or fingers. If it is necessary that the whole body be dissected some remission of knowledge of detail may still be possible.

During the last thirty years medicine has been coming closer to physiology, and physiology has, on the whole, become less medical. During the nineteenth century the functions of organs in health were determined in many cases by observations made on hospital patients in whom these organs were diseased. Physiology in those days depended in part at least on observation, and not as yet entirely on experiment. The dependence of the study of the normal on the study of the abnormal was obvious; physiology had its origin in medicine and pathology.

Few branches of natural science have developed more rapidly during the last forty years than physiology, and this country has good reason to be proud of the great men who towards the close of the last, and at the beginning of the present, century, made English physiology famous throughout the world. In 1903 a well-known German chemist said to the author of this article, "physiology is really (*eigentlich*) an English science." The great development of physiology as a branch of experimental biology has affected the relation of physiology to medicine, and the attitude of physiologists to the medical student. Students destined for medicine, as they passed through the physiological laboratory, have been fascinated by the work which they saw in progress and have remained to become "unqualified" physiologists. Who will blame them? Medicine has been the loser. Physiology, emancipated from her "mother" Medicine, contracted closer alliances with chemistry, physics, and mathematics. The human body came to be regarded as a maze of semi-permeable membranes inhabited by electrolytes and colloids. Physiology moved towards chemistry and physics, and away from anatomy and zoology. The interest of physiologists in histology, and the relation of microscopic structure to function waned, and the gap between anatomy and physiology, between structure and function, widened. For the education of the medical student the correlation of anatomy and physiology can hardly be too close. Does the modern student look on the physiological laboratory as the place in which he studies the functions of the organs which he sees in the dissecting room?

On the other hand, advances made by physiologists in the first quarter of this century have been of great and direct value to the physician and the surgeon. The physician of to-day is probably more interested than his predecessor in the application of the methods of the physiological laboratory to the diagnosis of disease. Every branch of science must change its ground if it is to change its point of view. Change is necessary to progress, and there has been progress. But for the sake of the medical student who must learn many subjects within a relatively short period of years correlation of subjects is always an urgent necessity.

A reviewer of the history of medicine might point with justice to the development of chemical methods in the medical and biological sciences as one of the great events of the last thirty years. Etiology and diagnosis, prevention and treatment, have all benefited by the introduction of chemical methods. Nearly all critics of the medical curriculum insist on the urgent need of more instruction in chemical theories and methods. To-day the student is taught elementary inorganic chemistry at school; a short course of elementary organic chemistry is taken at school, or more often at the university. Organic chemistry is the subject of a special examination. A gap, more or less unbridged for the student, separates the organic chemistry of the department of chemistry from the physiological chemistry or biochemistry of the departments of physiology or biochemistry. At a late stage in the curriculum instruction is given in the chemical laboratories of some hospitals on chemical methods of diagnosis. Instruction in chemistry is imparted to the student in instalments. But the progress which has taken place in the knowledge of chemistry as applied to biology has resulted not so much in the correlation of the chemistry of living with the chemistry of non-living matter, as in a divorce of biochemistry from its intimate partnership with physiology, pathology, and medicine. Biochemistry, which started as chemical physiology, has become an independent branch of biology. Physiology, pathology, and medicine are not the only branches of biology which have problems which may be solved by chemical methods. Zoology, botany, and agriculture have chemical aspects and interests. Biochemistry is no longer a part of the department of physiology, but has become consulting chemist to all biological departments. How has the development of biochemistry affected the medical curriculum and the medical student? In this consolidation in one department of all the chemical interests of all branches of biology we may study some of the problems connected with the correlation of the subjects of the medical curriculum.

The medical curriculum has been regarded as divided into three periods or strata, after the fashion of a jam sandwich cake—the elementary science layer, the physiology and anatomy layer, and the hospital practice layer. There is chemistry in each layer. Now it is well known that the integrity of a cake must be destroyed by any method of section. But if the pieces are kept well together the appearance of a complete cake may be preserved. Difficulty in keeping the pieces together must arise when cutting in two planes is allowed. If the chemist or biochemist is permitted to cut out a slice, like a slice of plum cake, which contains the chemistry of all the three layers, the layers are going to suffer. It is difficult to teach physiology or pathology or medicine unless the chemical aspects of these subjects are treated as an integral part of these subjects. A man should not teach pathological chemistry unless he has a good knowledge of chemistry; it is equally true that he should have a good knowledge of pathology. The example of chemistry in its relation to biological subjects is instructive to the student of the medical curriculum, and illustrates the difficulties of the correlation of subjects.

The grand cañon of the curriculum separates anatomy and physiology from surgery and medicine, a vast gulf across which it has been the pathologist's ambition to build a bridge. The days have gone, no doubt, when the student on his arrival from Oxford or Cambridge at a London hospital was congratulated on his knowledge of science and advised to forget it as quickly as possible. Nevertheless the gap between the laboratory and the wards is still big, though, to-day, willing hands are stretched out to help the student over. Medicine has never been quite certain whether she regarded herself as a science or an art, and her indecision is reflected in the curriculum. The M.B. course of a university starts as if the goal was a B.Sc. with honours in biology. The last years are devoted almost exclusively to clinical instruction of the most practical kind. The student is apt to regard all examinations

up to and including those in anatomy and physiology as a series of preliminary tests which must be passed before he is allowed to begin real work in a hospital. He has spent two years, perhaps, in the laboratories at a public school, and two years at a medical school; does he bring with him to the wards the equivalent of four years' experience and training in natural science? Attempts are made, it is true, to enable the student to make the best use of such knowledge as he may bring with him. Classes are given in some medical schools during the clinical years in applied physiology and anatomy. The medical and surgical units are essays in the combination of laboratory with clinical methods.

Of all the subjects of the medical curriculum pathology is best placed to help the student in the co-ordination of his experiences of normal and abnormal biology. Now Pathology, the youngest daughter, has made herself so useful that Mother Medicine has been very unwilling to allow her to grow up and become an independent science and have a house of her own. But Mother Medicine has kept Pathology at home with her in the hospital to look after the mortuary and the museum, and to cut sections and write reports on tumours. Later on, Pathology taught herself to prepare culture media, grow bacteria, make vaccines, and to perform chemical examinations. Pathology has been an extremely useful maid-of-all-work, and on winter evenings, after the work in the wards is done, the students, if they are not too tired, come to her that they may be told something of the laboratory methods by which certain diseases may be diagnosed or treated.

In the majority of the universities of Scotland and England a formal course of pathology occupies a portion of the student's time during the twelve months which follow the examinations in anatomy and physiology. These courses coincide with the first year of hospital work; they are over too soon, before the student is in a position to correlate medicine with pathology—the study of disease in the ward with the study of disease in the laboratory. The student is apt to regard pathology as the last of the long series of obstacles which he must surmount or evade before he is permitted to devote his attention to medicine.

In the London schools the time devoted to systematic instruction in pathology is less than in the North. In some hospitals an introductory course in general pathology and bacteriology is given during the first three months of clinical work. Courses, possibly slightly more ambitious, but of a very elementary and introductory character, are given at Oxford and Cambridge in order that medical students may have some notion of pathology before they migrate to a London hospital. Students, after they have begun clinical work in the wards, have little time and little opportunity for the study of pathology. Morbid anatomy can be learned in the post-mortem room. In some hospitals pathological clerkships in connexion with clinical laboratories afford chances of acquiring practical experience of useful diagnostic methods. Lectures are not always given during the same term, and often bear no relation to courses of practical instruction. There is too little co-ordination of the teaching of morbid anatomy with morbid histology, with bacteriology, and with chemical pathology. Pathology is presented to the student as a laboratory branch of diagnosis. The examinations in pathology which form part of the Final Examination in the London University, at Oxford, and at Cambridge are often regarded by the student as an additional examination in a special subject —as an added burden. The examination in pathology at Oxford is a part of the Final Examination, but may be taken as a separate part before the examination in the clinical subjects. There can be no other three subjects within the whole medical curriculum so nearly allied as medicine, surgery, and pathology, no other three subjects which offer such opportunities for co-ordinated teaching; to the student, then, pathology, medicine, as a separate should be one subject. Pathology is Examination; this science, nor is it a system of biology. In the case of learned at the completion of universities accept one or study; it is the study of diseased by the joint university laboratory, just as medicine and surgester can choose one pathology by the methods of the wards. ult for a school-

begin the study of disease in the laboratory at least as early as it is begun in the wards, and laboratory study should be correlated with ward study throughout the clinical period.

It is neither within the scope of this article, nor within the powers of its author, to discuss details of clinical teaching. Practical instruction in medicine and surgery must be the backbone of the curriculum, and the product should be a man skilled in the prevention, diagnosis, and treatment of disease. This article is concerned with the branches of natural science, some understanding of which is essential to the study of medicine and surgery. But it appears that within the period of clinical study influences are at work similar to those which have been discussed in connexion with the period of laboratory study. There has been a comparable increase of knowledge, and a comparable tendency to specialization, with the splitting off of special departments concerned with certain diseases or groups of diseases, or with special methods of diagnosis or treatment. There is a tendency to insist on certificates of attendance at each special department, and demands are made from time to time for special papers on special subjects, and the appointment of special examiners. Taken by itself the case for each of these special subjects may appear incontrovertible. But if the claims of all the special subjects were admitted in full there would be little time within the three years' period of clinical study for general medicine and surgery.

In all medical schools lectures are given on forensic medicine, and on preventive medicine and hygiene; some universities insist on special examinations in these subjects. The standard of knowledge in forensic medicine which can be demanded of a medical student hardly seems to warrant the dignity of a special examiner and a special paper. From the nature of the subject practical instruction can only be fortuitous, and it does not seem necessary that the burden, admittedly a very temporary burden, of details derived from a textbook or lectures should be added to the student's heavy pack. The importance of preventive medicine is beyond dispute. But the prevention of disease is the concern of every teacher of medicine, surgery, and pathology; it does not seem reasonable to isolate the prevention of a disease from its etiology, diagnosis, and treatment. If the lecturers on medicine, surgery, and pathology fail to deal with the prevention of diseases on which they lecture, they must fail to do justice to the subjects committed to their charge. Candidates should be, and in fact are, examined in preventive medicine by examiners in medicine, surgery, and pathology, and there is no need for a special examination in this subject.

The object of the medical curriculum is to provide a training for medical men, the majority of whom will spend their lives in the practice of medicine and surgery. Training in the diagnosis and treatment of the sick is provided by the practice of a general hospital, and the problem of the medical curriculum is to provide the best possible foundation for clinical work. At Oxford and Cambridge students are encouraged to take advanced courses in natural science leading to a B.A. with honours, and at other universities exceptional students take additional courses in science and, at the expense of an extra year, secure the B.Sc. degree. A generous education in the natural sciences, and especially in one or more of the branches of biology, is the best possible preparation for the study of medicine. Men well grounded in the theories and methods of the natural sciences make the best recruits for the medical profession, and may be expected to provide pioneers, research workers, and teachers. There will always be a need for men of this type, and always work for them to do. But the bare minimum of professional knowledge and experience which every student must acquire before he passes a qualifying examination has increased and is increasing, and if the medical student is ambitious to reach the standard of an honours degree in pure science—the same standard as is required of a medmedical student of science who is unhampered by principles professional examinations—and satisfy all the ened wheents of the medical curriculum, he must be preillustrater very strenuous work and a considerable addition professears of training.

It is of the first importance for the future of the medical profession that facilities for advanced training in the natural sciences should be available for those medical students who are able to take advantage of them. It is important that every encouragement should be given to medical students to devote additional years to the study of science from an unspecialized and non-professional standpoint. From this point of view the less the connexion of the science which is studied with medicine the better. Men whose training before they enter medicine has been generously broad will bring new ideas with them into medicine. But not all medical students become research workers or teachers, and not a very large proportion of students have the inclination, time, or money for additional courses in science. A love of pure science for pure science's sake is not the only, and possibly not the most important, quality for success in general practice.

What should a man know before he is allowed to begin clinical work at hospital? It is desirable, but it is not essential, that he should be up to the standard of a B.Sc. with honours. In the case of the majority it would be unreasonable to suggest anything of the kind, but in practice we do require that every medical student shall take a series of courses and examinations in various branches of natural science which amount in all to about the standard of a pass B.Sc. The standard required is not high enough to ensure that the student is a good scientist, but it may well be much more than the amount of preliminary training necessary to make a good doctor. A hundred years ago or so it is believed that the sum total of all the natural sciences was so small that the larger minds then living could hold it all. At the end of the last century it was possible for a student to spend two or three years in the laboratories, and then two or three years at a hospital, and feel at the end of five or six years' study that he had covered a reasonable proportion of natural science and medical practice. To-day three hard years of work at a hospital are barely enough, if they are enough, for the acquirement of the essential minimum of clinical experience. The time may not be far distant when another year will be added to the period of clinical study. Before these three years must come two years of work in the dissecting rooms and the laboratories of a medical school, and from one to two years' work in the laboratories of a public or secondary school.

Does the student get full value or even a proper equivalent for the three or four or more years of laboratory work which he must do before he enters the wards? For the majority, for those who have neither the time, nor the ability, nor the wish to take full advantage of the advanced courses in natural science which universities provide, it would be a great advantage if the necessary minimum of compulsory preclinical laboratory work were substantially reduced. A reduction would involve a most careful consideration of the kind and amount of knowledge and experience which every student must possess before he is allowed to begin clinical work.

That the preclinical laboratory work of the curriculum is in urgent need of consideration and revision few will doubt. Definite expressions of opinion are needed from all responsible for teaching medical students and especially from those who teach during the period of hospital practice. From these opinions information could be obtained as to what might be included with advantage and what might be excluded from the curriculum without loss. In all probability the period of preliminary laboratory study might be reduced. Even if no reduction of time should be found possible, it seems almost certain that the time might be better spent, and the training in the laboratory better adapted to its object—the preparation of the medical student for the practice of medicine. The day has passed when the student could be allowed to browse at leisure for a few years on the pastures of pure science before he was harnessed in earnest to the chariot of Aesculapius. Above all there is need for co-operation between the teachers of the various subjects, and correlation of the subjects taught, so that the relation of the various subjects to one another should be obvious to the student. All the courses contained in the curriculum should be co-ordinated to form an ordered sequence. At present the student is required to attend classes and pass examinations in a number of apparently unrelated branches of science, he is given to understand that the assorted knowledge which he gains will be of value to him later on. In any case much of the value of the training is lost from the hurry, strain, and stress involved by the long series of examinations by which the student is harassed from an early age, and which rob him of much of the pleasure and profit which he might derive from a more leisured study of the natural sciences. The medical student is examined far too often, and in consequence more of his time is spent in cramming than in profitable study. One great advantage which would result from a shortening of the period of preliminary laboratory study would be an increase in the time available for general education. It is useless and almost scandalous to prescribe an age limit below which boys may not be registered as medical students, and at the same time make the passing of examinations in elementary science a necessary preliminary to registration so that schoolboys are in fact required or advised to begin professional study one or two years before they may be registered as students. It would be a distinct gain to medical education if no incentive was offered to schoolboys to work for professional examinations before their last year at school.

In any consideration of the laboratory work which the student does at the medical school, the arrangement of the laboratory subjects and their relation to clinical work in the time-table might receive some consideration. Is it essential or even really advisable to insist on the completion of the study of anatomy, physiology, and biochemistry before clinical work is begun? The student would take a far greater interest in anatomy and physiology if he had come in contact with patients in a hospital, and was in a position to appreciate for himself the importance and significance of these sciences. How much of the student's laboratory work should be preliminary to his admission to the wards? The correlation of medicine and surgery with anatomy, physiology, and pathology during the whole or the greater part of the five years of the curriculum would offer great opportunities to both teacher and student. The advice "Study this carefully and you will be rewarded by finding the knowledge very useful to you in a few years" is part of the regular stock-in-trade of the laboratory teacher in the faculty of medicine. There seems no valid reason why the study of morbid anatomy should be postponed until the study of normal anatomy has been certified as complete by examination. Some reference to disease, to pathology, and to medicine is essential to an understanding of physiology. The observation of changes produced by disease should be supplemented by the study of lesions produced by experiment. Could there be anything but gain if the teaching of normal physiology to medical students was continually illustrated by examples of abnormal structure and function shown in the wards and post-mortem room of a hospital? The most elementary course on metabolism, on biochemistry, or on physiological chemistry must be illustrated by the consideration of diseases of the ductless glands. Would the student take less interest in biochemistry if he was allowed to see living examples of deficiency diseases, or to obtain and examine for himself specimens from a case of diabetes? The opportunity for co-ordination of the subjects of the curriculum is great, and the need for active co-operation between teachers seems evident.

In conclusion, the author of this article is aware that it is presumption for any one individual to attempt a review of the whole curriculum and all its diverse and distracted elements. Or the errors of individual judgement this article must afford innumerable examples. On the actual curriculum, which spreads over so many years and comprises so many and so different subjects, it is certain that individual teachers will hold and occasionally dare to express various and divergent views. All the greater is the need for the expression of individual opinions, however imperfect and one-sided though they be, for criticism and for co-operation between all whose duty it is to shape the great responsibility of training [illegible] the profession of medicine.

The Profession of Medicine.

INTRODUCTORY.

For many years it has been our custom to publish some weeks before the opening of the winter session a special Educational Number. The form and contents of this annual issue have undergone modifications from time to time, but its purpose has remained unchanged, and the seasoned medical reader must expect to find in it a great many facts and phrases with which he is only too familiar. The first object of the Educational Number is to give prospective students and their parents full information about the steps that must be taken and the studies that must be pursued in order to become a registered medical practitioner. The second object is to be of use to those wishing to know what a medical career has to offer, and to others who, having already chosen medicine as their life-work, or having entered upon it, are uncertain about the line of work for which they are best suited. The intention is to supply information rather than to offer advice; but, as in past years, this introductory article gives an opportunity of reviewing some aspects and tendencies of medical study and practice, in order to help those who think of becoming doctors to estimate their fitness for the calling and the prospects it holds out. At the present time medicine as a profession is undergoing great changes, which are viewed in very different lights by different observers. For this reason we shall keep as far as may be to facts, leaving the reader to decide for himself whether medicine is a desirable career to adopt, but directing attention to a few points which might not occur to anyone without some experience of the medical life.

Intending students will find in the pages that follow an account of the course of training required of them, the places where it can be obtained, and the universities and other licensing bodies which test the knowledge gained and confer degrees or diplomas entitling successful candidates to become legally qualified medical practitioners. Sections are included also on post-graduate medical study, on the higher qualifications, both general and special, and on the many and varied spheres of work open to registered medical men and women at home and abroad. The details given are founded on official information, and arranged along the customary lines.

Before proceeding further it may be well to repeat here, what has often been said before, that the aim of a medical education is to impart not only the essentials of medicine, but also the right principles and methods of adding to knowledge after qualification. Such teaching, to be effective, presupposes a good general education. Next in importance is a good scientific education—a thorough grounding in the basic principles of science. Upon these the student of ordinary intelligence and industry can build up an adequate technical equipment for the practice of his profession. An unfortunate tendency in studying the preliminary subjects is to acquire a mere "cram" knowledge, quickly forgotten after the particular examination is passed. These sciences interlock with each other and with the later subjects, and, properly approached, they give a drilling in exact methods and vigorous reasoning which will bear immediate fruit in the clinical part of the curriculum. Chemistry, physics, and elementary biology prepare the way for anatomy and physiology, and so for medicine and surgery and obstetrics. The curriculum is not perfect. It is ever undergoing revision continually, to keep pace with new science, and improvements in practice. But all authorities agree that these preliminary and intermediate study; it is the study learned at the laboratory, just as only appropriate introduction to the pathology by the medicine.

PORTALS OF THE PROFESSION.

The obvious goal of every student is the entry of his name in the *Medical Register*, which is the official statutory list of qualified medical practitioners kept by the General Medical Council. Those who are not acquainted with the system of medical teaching and examination in these islands, and with the history of our professional institutions, may well feel bewildered at the number and variety of ways in which admission can be obtained to the *Register*. They will see in the table of contents to this Educational Number that there are no fewer than twenty-seven bodies—eighteen universities and nine corporations—which either separately or jointly issue registrable qualifications; and the number of teaching institutions is even larger. Nevertheless, although we have no single State examination in medicine—no "one portal system," as it has been termed—the medical courses of the various universities and schools in Great Britain and Ireland run on parallel lines, and the obligatory curriculum is much the same for all students. As, however, the individual teaching and examining bodies have different standards and requirements, the choice should be made early, so that a definite plan may be followed.

If possible the decision to study for a university degree in medicine should be made by the time a boy or girl is 15. A matriculation examination or its equivalent should be attempted without delay, and the parent should ensure that the special requirements of the medical faculty of the selected university are fulfilled. As soon as this examination is disposed of work should be begun at school in the subjects of the First M.B. Few house-masters at public schools seem to be adequately informed about medical requirements under the revised curriculum, and it is doubtful if all schools are fully competent to meet the varying requirements of different authorities. Parents should therefore make inquiries on their own account in order that valuable time may not be wasted during the last year or two at school. This applies to all prospective medical students, but with special force to those seeking degrees at Oxford or Cambridge and desirous of getting the best out of the university.

All who wish to enter the profession must comply with certain conditions. These are regulated by the General Medical Council, which is a statutory body set up under the Medical Acts; a summary of its functions and requirements is given at page 351. Many changes have lately been made in the medical and pre-medical curriculum, and this section, as well as the article on Professional Study and Examination, should be studied with care. It is the business of the General Medical Council, so far as possible, to see that a suitable kind of training and the requisite degree of knowledge are secured to the student, and it is the business of the medical schools and examining bodies to give the training and test the knowledge in accordance with the requirements of that Council. Every student, after passing examinations in the subjects of general education and in the preliminary sciences of chemistry and physics, must take a course of training at a recognized medical school, covering a period of at least five years, but usually extended to six years or more.

Examination of candidates as to their fitness to practise medicine, surgery, and obstetrics is left to the licensing bodies, which are of two kinds—the universities, and certain medical corporations in England, Scotland, and Ireland. The requirements of these licensing bodies are summarized elsewhere under separate headings. One of the functions of the General Medical Council, besides that of keeping the *Medical Register* and maintaining discipline

within the profession, is to make sure that the tests at each stage do not fall below a certain standard, and that the students examined have undergone prescribed courses at approved institutions. Successful candidates eventually receive either degrees, in the case of a university, or diplomas or licences, in the case of a corporation; these qualifications entitle them to claim insertion of their names in the *Medical Register*. Every student, as soon as he obtains his qualification to practise, should at once register; otherwise he cannot hold a public medical appointment, or sign any certificate required from a legally qualified practitioner (such as a death certificate), or recover professional fees in a court of law.

Holders of diplomas and licences once made up the great majority of all medical men, especially in England and Wales. But universities have greatly multiplied during the present century, and so many practitioners are now graduates in medicine that a student at the threshold of his career will do well to consider the advantages of possessing a degree, though it may be desirable to take also a diploma or licence. The medical degrees (M.B., M.D., etc.) granted by the universities in Great Britain and Ireland are mentioned among the particulars about each university printed in later sections.

COST OF MEDICAL EDUCATION.

To those who have already decided to send their sons into the medical profession, no less than to those who are weighing the matter, a few words on the cost of medical education may prove helpful. For the ordinary student this resolves itself into the cost of the training at medical school and hospital, and the cost of living during the five or six years of the curriculum. The expenses under these two main headings vary considerably. Besides differences in the charges made for instruction, there are differences in examination fees, as well as in the fees for certificates of qualification, and those who seek the higher degrees and diplomas must expect to pay more for the additional courses and tests and certificates. Again, not all students, however industrious, have the knack of imparting what they know to an examiner, and every setback due to failure in the examination room or to illness means added expenses. School and examination fees, together with the cost of board, lodging, clothes, and recreation, form the largest items of expenditure, and to these must be added the money spent on books, microscope, instruments, and so forth.

Since professional education must in any case continue for five years at least (a period exceeded by the vast majority), and since the cost of living varies much in different parts of the country, while personal expenditure varies still more, it can only be said in a general way that anyone who thinks of entering the profession should be prepared for an outlay of at least £1,500. Something between two-thirds and three-quarters of the whole amount would probably be spent on maintenance, and the rest in fees, etc., for tuition and examination. The fees charged by the different schools and licensing bodies are stated in the paragraphs relating to each on other pages of this issue. When making an estimate of the probable outlay, the many helps available nowadays for the reduction of expense should not be ignored. At nearly all the medical schools more scholarships and money prizes are offered now than in the past; at the Scottish universities bursaries are numerous; and the Carnegie Trust (whose regulations are summarized at page 363) gives pecuniary help to many Scottish students. A first-class medical education, leading to the possession of a good medical degree, is probably to be obtained for a smaller outlay in the university cities of Scotland than anywhere in the south. The main thing to bear in mind when considering costs is that, as compared with other professions, the period of training in medicine is long, and for most students expensive. Further guidance on this matter will be found in a memorandum,[1] drawn up by the Registrar of the General Medical Council, on the procedure to be followed in order to enter the profession. This pamphlet gives much useful information, including a comparative table of the cost of study and examination at the various institutions.

Since medical students are not commonly the sons or daughters of wealthy parents, it is usual, before setting out upon this long and exacting course of study, to weigh, not only the cost, but also the prospects. An overcrowded curriculum would be hard to face if all that could be discerned at the end of it were an overcrowded profession. The youth and the girl of to-day, when reckoning up their chances in any calling, will wish to know the probable numbers of their competitors for the work that is waiting to be done.

THE NUMBERS OF MEDICAL STUDENTS

The following brief survey should be read with the notes and tables printed at page 350 on the numbers of registered students and practitioners. More new students mean more new doctors five or six years later, though, as the chart shows, there is in normal times a fairly constant wastage.

At the close of the last century the annual entry of medical students in Great Britain and Ireland had been on the average about 1,800, and then for the next thirteen years it stood at about 1,400. During the war period, although many students left to serve with the forces, the entries grew steadily larger, so that in 1918 they were 2,253, and in the following year, when demobilization was in active progress, they were 3,420. In the next five years the numbers rapidly fell, but from 1923 to 1928 they remained at a fairly steady level rather below the immediate pre-war average. In 1924 the entries were 1,043, in 1925, 1,070; in 1926, 1,269, in 1927, 1,214; and in 1928, 1,362. Last year they rose again to 1,502.

The excessive entries during the post-war inflation period, if they had gone on long enough, must have led to overstocking of the profession. In the past decade the numbers of new practitioners registering each year have greatly exceeded the usual pre-war figure of eleven hundred or so. The large additions to the profession in recent years brought the total number of names in the *Medical Register* up to 54,870 at the end of 1929. This is upwards of ten thousand more than the figure for 1919, fourteen thousand more than that for 1909, and nineteen thousand more than that for 1899. The population of the British Isles has not increased at anything like that rate during the same decennial periods, and the ratio of doctors to inhabitants is therefore much higher now than ever before. It should be borne in mind, however, that the scope of medical practice has enlarged considerably in the meanwhile, and many fresh openings for professional work have followed advances in diagnostic, curative, and preventive methods, and the rapid development of administrative medicine. On the whole, it appears that the medical profession of this country is now large enough, but not yet overstocked.

AFTER REGISTRATION: CHOICE OF A CAREER

The student, having passed all his tests and placed his name on the *Medical Register*, assumes the privileges and responsibilities that go with legal qualification. But after registration there is usually a period of transition between pupilage and established practice. This time may be put to the greatest advantage by serving as house-physician or house-surgeon, or casualty officer in a hospital, by working as assistant or locumtenent in private practice or by seeing something of the world as a ship-surgeon. As a preliminary to practice of whatever kind, a year or more spent in junior hospital appointments is a most profitable investment.

[1] *Memorandum on the Procedure to be Adopted by those who desire to enter the Profession of Medicine, with Notes on Cost and Prospects.* General Medical Council, 44, Hallam Street, Portland Place, W.1. Price 1s. post free.

and most specialists are consultants in the sense that their work largely comes to them through the recommendation of general practitioners, with whom they act (or should act) in a consultative capacity. In any case, whoever holds himself out as one or the other, or both, must be assumed to have knowledge and skill above the ordinary.

The successful pursuit of a specialty is hard to achieve except by the aid of appointments to hospitals, particularly those with medical schools. These posts are much sought after, and the time of waiting for a vacancy may be long. It follows, then, that the would-be specialist, since he can scarcely hope at first to pay his way by the exercise of his specialty, must either have private sources of income or be prepared, by teaching or in other ways, to make ends meet. Competition in this branch of practice is very keen, as anyone can prove by counting the name-plates on the doors in the Harley Street area of London, or in corresponding parts of other large cities. Expenses are heavy, and the young consultant or specialist may have to go through a long period of training and waiting before he makes an income; but on the other hand success, when it comes, is liberally rewarded.

A comparatively new feature of medical life, especially in the larger industrial towns of the North of England, is the growing number of "general practitioner specialists," who combine ordinary panel practice with much surgical or other special work in well-equipped local hospitals which admit patients in different categories according to their means. Though the fees are small compared with those earned by operating surgeons and specialists in London, the work is by no means unremunerative.

Additional degrees and diplomas are important factors in securing election to the visiting staff of a large hospital, and a few remarks about them may be made here. Beyond the qualifications which admit to the *Medical Register*, most of the licensing bodies bestow higher titles after further tests. A considerable number of those who have graduated M.B. at a university, including many general practitioners, proceed later to the M.D. When applying for the post of physician to a hospital it is always useful, and may be obligatory, to hold also the Membership of one of the three Royal Colleges of Physicians, according to the part of the British Isles in which the hospital is situated. So, too, the Fellowship of one of the three Royal Colleges of Surgeons should be obtained by those seeking surgical appointments, and the degree of Master of Surgery is an added distinction. There are also diplomas in a growing number of special branches of work—such as public health, tropical medicine, ophthalmology, laryngology, radiology, tuberculosis, psychological medicine, and midwifery—which are superfluous for most practitioners, but may be useful or even indispensable for those who intend to devote themselves to one or other of these subjects. Information about the special diplomas open to qualified practitioners, and about higher degrees, will be found on other pages.

FINANCIAL AND SOCIAL ASPECTS.

The rewards of a profession come under two heads: those that depend on the intrinsic pleasure of the occupation, and those associated with financial success and material dignity. The pecuniary disadvantages of medicine are the long and costly training, the time of waiting after qualification before the practitioner can count upon an adequate income, and the heavy working expenses in proportion to gross earnings. On the other hand, it holds out the prospect of a fairly certain income, with unrivalled opportunities for exercise of the intellect in the service of others. There are many briefless barristers, but the qualified practitioner of medicine should never want for a livelihood so long as he keeps his health and his good name. But while no doctor who is willing and able to work need starve—which can scarcely be said of any other learned profession—those who think of adopting it as a career ought to understand that medicine is a path to fortune only for the few. Whatever the branch of work chosen, it is rare for a doctor to become what a business man would consider even moderately rich by the practice of his profession.

Yet if medicine, from the financial point of view, offers to most men little more than a means of livelihood always at command, in its social and cultural aspects the outlook is far brighter. As regards the satisfaction derived from the work itself a doctor's life need yield to none in the matter of sustained and varied interest. His lot is unlike that of many whose business gives little scope to the higher faculties, for he lives in, and by, the exercise of his intellectual powers. Moreover, the general culture which in past centuries belonged to the physician alone has spread into all ranks of the profession. The steady improvement in the education of the practitioner has added much to his influence with the public, and has been a large factor in raising his social status during the seventy years that have passed since the General Medical Council was constituted under the first Medical Act. Medicine gives to those who follow it an honourable position, and one whose dignity is gradually advancing with its progressive success in prevention and cure. The well-educated doctor stands high among his neighbours, and is the friend and confidant of his patients. Many men go further, and take a prominent part in the public life of their district. A proof of the all-round value of a medical training is the way in which it fits men for leadership.

PROFESSIONAL ORGANIZATION.

All who follow the calling of medicine, varied as their work may be, constitute a single brotherhood bound together by common interests and aims. The spirit of comradeship, which counts for so much in student days, should be preserved, both for its own sake and because no doctor can safely stand aside from his fellows. Individuals and isolated groups of practitioners are always at a disadvantage when they try to defend their interests against organized bodies, whether these are Government departments, local authorities, or commercial companies. In his daily work the doctor is well able to deal with the individual patient and the patient's friends, but he cannot stand up single-handed to outside organizations. But apart from motives of self-interest, every one of us owes a duty to our profession, and the doctor who holds aloof fails in that duty. Medical men and women must therefore band themselves together, and the first step after graduation should be to become an active member of the British Medical Association. Besides having behind him the machinery and the influence of a world-wide professional body, a young practitioner will find in the meetings of his local Division, and in the Annual Meetings of the Association, many opportunities for keeping abreast of new work and for friendly intercourse with colleagues. Another thing that no new graduate should fail to do is to join one of the societies which for a small yearly sum undertake individual legal defence of their members. The need for protection may arise out of the first case attended in hospital or in private practice.

The British Medical Association was founded in 1832 to promote the medical sciences and maintain the honour and interests of the profession, a brief note on its constitution and activities will be found at page 403. The only body that can act for the profession as a whole and speak in its name. The record of ninety-eight years' work shows that vocational organization, wisely directed, can combine service for its members with service for the public; but much still remains to be done in both ways. Every medical man and woman should try to take a share in some of the movements, scientific or social or political with which the Association has identified itself.

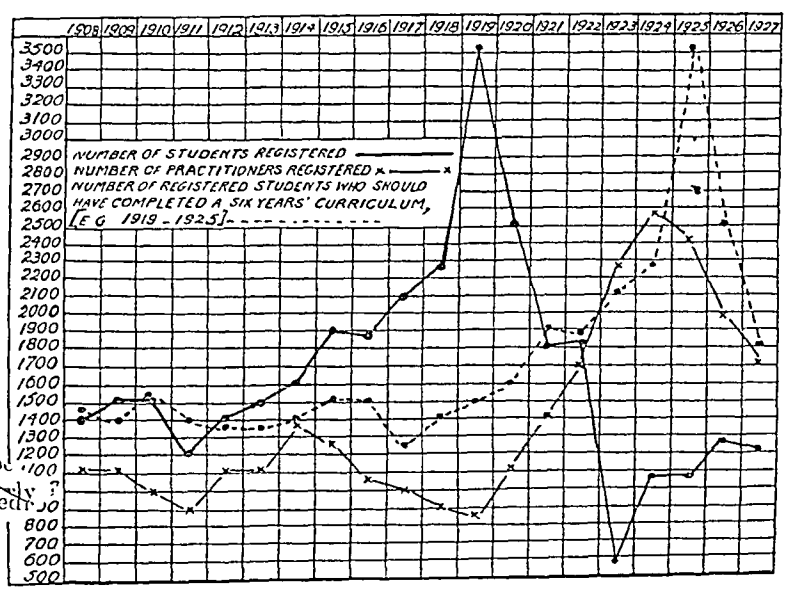
NUMBERS OF THE MEDICAL PROFESSION.

A REVIEW OF FIFTY YEARS.

IN order to present a general view of the numerical strength of the medical profession during the past half-century we have extracted from the records and set down below in parallel columns the total number of names in the *Medical Register* on December 31st of each year, and the numbers added annually by registration between 1880 and 1929.

Numerical State of the "Medical Register."

Year.	Names added in Year.	Total No. on Dec. 31.	Year.	Names added in Year.	Total No on Dec. 31.
1880	1,123	22,936	1905	1,240	39,060
1881	1,053	23,275	1906	1,197	39,529
1882	1,171	23,801	1907	1,221	39,827
1883	1,304	24,517	1908	1,137	40,257
1884	1,388	25,321	1909	1,143	39,818
1885	1,377	25,998	1910	1,062	40,483
1886	1,431	26,452	1911	1,012	40,913
1887	1,531	27,246	1912	1,157	41,439
1888	1,184	27,939	1913	1,168	41,940
1889	1,305	28,348	1914	1,433	42,378
1890	1,266	29,163	1915	1,526	43,225
1891	1,345	29,555	1916	1,202	43,481
1892	1,513	30,590	1917	1,131	43,819
1893	1,579	31,644	1918	1,077	43,926
1894	1,426	32,637	1919	1,322	44,510
1895	1,446	33,601	1920	1,457	44,761
1896	1,385	34,478	1921	1,760	45,408
1897	1,230	34,642	1922	1,983	46,476
1898	1,210	35,057	1923	2,482	48,140
1899	1,351	35,836	1924	2,796	50,035
1900	1,345	36,355	1925	2,570	51,738
1901	1,318	36,912	1926	2,120	52,614
1902	1,275	37,232	1927	1,941	53,769
1903	1,233	37,878	1928	1,656	54,336
1904	1,168	38,492	1929	1,410	54,870



The varying proportion of registered medical practitioners to population during the period under review is shown in the following table. This sets out the total population of the British Isles at each decennial census since 1881, and the number of names on the *Register* in the same year; also the corresponding totals for the mid-census year 1926.

Proportion of Practitioners to Population.

Year.	Registered Practitioners.	Population, British Isles.
1881	23,275	35,241,482
1891	29,555	38,104,975
1901	36,912	41,976,827
1911	40,913	45,370,530
1921	45,408	47,146,506
1926	52,614	48,190,000

These figures show a steady increase in the ratio of doctors to population, which was accelerated during the years immediately following the war. The number of registered practitioners at the end of 1921 was nearly double the number at the end of 1881, but the population of Great Britain and Ireland within that an expectation of forty years practice was shared by about to serve this is. There is conditions resembling more

The general practitioner in every department of medicine more comprehensive outlook devoted to perfectionated that there is one medical practitioner to every 753 people. Next to the United States the British Isles appear to have the highest proportion of practitioners to population. Austria has approximately one doctor to every 900 inhabitants; Switzerland 1 to 1,135; Denmark 1 to 1,200; Germany 1 to 1,320; France 1 to 1,470; Hungary 1 to 1,480; and Czechoslovakia 1 to 1,970.

Numbers of medical students and practitioners, 1908 to 1927.

REGISTRATION OF STUDENTS AND PRACTITIONERS.

The relation between the numbers of new students and those of newly qualified practitioners during recent years is shown in the accompanying chart, reproduced from the report of the Finance Committee of the General Medical Council for 1928.

The figures for the registration of practitioners year by year apply only to those whose names were entered on the British list, entries in the colonial and foreign lists of the *Medical Register* being excluded; hence the slight discrepancy between the totals indicated in this chart and those given in our tables printed above. The chart brings out in a striking way the difference between the number of registered students who should have completed a six years' curriculum in a given year and the number of newly qualified practitioners who in fact registered in that year. In 1919, following the armistice, there was an enormous entry of students; but a considerable proportion dropped out of the running year by year, and in 1925 the number of those who qualified fell short of expectations by nearly 1,000. Since then the two figures have approached each other again, and it is reasonable to suppose that the pre-war relationship between them will be resumed. Some further remarks on the numbers of medical students in recent years will be found in our introductory article on the profession of medicine.

PROFESSIONAL STUDY AND EXAMINATION.

THE MEDICAL CURRICULUM TO-DAY.

IN 1922 the General Medical Council prescribed a readjustment of the medical curriculum, to come into force at the beginning of the following year. The scheme adopted was in effect a compromise between several "schools of thought" which had been debating the matter for fifteen years or more. In this readjustment, among other things, increased emphasis was placed upon sufficient opportunity being afforded for the study, both theoretical and clinical, of those subjects which are now so essential in connexion with the treatment centres of a local authority, such as ophthalmology, venereal diseases, orthopaedics, ante-natal conditions, and infant welfare. Our article printed at page 351 on the functions and requirements of the General Medical Council includes the text of the resolutions and recommendations of the Council which have applied since the beginning of 1923. We summarize below the leading features of the revised scheme of professional study and examination, and indicate the importance attached by the Council to the preventive aspects of medicine. The first qualifying examinations based upon this readjusted curriculum were held in 1928.

The minimum age for registration as a medical student is now 17 years. There has been no formal lengthening of the medical curriculum under the revised scheme, but in practice it has been added to by transferring to preliminary study and examination the subjects of elementary physics and chemistry in their purely scientific aspects. Thus, in addition to passing a preliminary examination in general education, an examination (written, oral, and practical) in the elements of physics and chemistry is required by the General Medical Council before the admission of a name to the Students' Register. In the applications of these two subjects to the professional courses—as in biophysics,

biochemistry, and pharmacological chemistry—appropriate instruction is to continue throughout the curriculum, and is to be tested by examination, so that the student shall no longer be able to put behind him as past and done with the knowledge which he acquired as a preliminary. If he has had no facilities at school or otherwise for obtaining what is necessary for the preliminary or pre-registration examination in chemistry and physics, then he can come for it to the university or medical school, but study for this will not count as part of the medical curriculum. In elementary biology comparatively few secondary schools are equipped for tuition, but the General Medical Council has suggested an arrangement for utilizing the work of such schools as are qualified for the purpose. The examination in elementary biology will not be "pre-curriculum," but the instruction may be so, and a licensing body can allow students who so desire to sit for the examination immediately after matriculation. Here again, however, it is the wish of the Council that the applications of biology to medicine, surgery, and midwifery shall continue to receive adequate attention throughout the courses.

A Block System of Study

Besides the resolutions of the General Medical Council in regard to professional education and examination printed elsewhere at page 353 a series of additional resolutions was adopted in 1922, as follows:

(*a*) That throughout the whole period of study the attention of the student should be directed by his teachers to the importance of the preventive aspects of medicine;

(*b*) That each licensing body should make adequate arrangements for the effective correlation of the several subjects of study throughout its curriculum;

(*c*) That the teaching of anatomy and physiology should include as a regular part of the courses the demonstration on the living human body of structure and function;

(*d*) That the curriculum should be so arranged that a minimum period of three years shall in every case be available for study after the completion by the student of the Professional Examinations in anatomy and physiology held at the close of the second year;

(*e*) That the curriculum should be so framed as to afford sufficient opportunities for the study, during the last three years of the course, of physics, chemistry, biology, anatomy, and physiology in their practical application to Medicine, Surgery, and Midwifery, and that the student's knowledge of these applications should be subject to test in the Final Examination;

(*f*) That before the student is admitted to his clinical appointments he should have received practical instruction in clinical methods and in the recognition and interpretation of physical signs;

(*g*) That instruction should be given, in the courses of Forensic Medicine and Public Health or otherwise, on the duties which devolve upon practitioners in their relation to the State, and on the generally recognized rules of medical ethics. Attention should be called to all *Notices* on these subjects issued by the General Medical Council.

The Council, it will be noted, attaches great importance to the reservation of sufficient time for the later subjects of study, free from all worries about passing the examinations of the earlier parts. To that end it recommends what is practically a block system. A minimum of three years should be available, not merely after the courses of anatomy and physiology have been taken, but after the examinations in these subjects have been passed.

Examination Reform.

Another notable feature is that in assessing marks in the several examinations account may be taken of "duly attested records of the work done by the candidate throughout his course of study" in the subject. This is an effort to meet the long felt difficulty that a man's mental agility, or the want of it, counts far too much in the examination room. The difficulty is real, but the remedy is not easy, and the Council has been wise in the cautious approach it makes towards a solution. Where, as in the examinations for the various conjoint diplomas, a student will only by chance come before his own teacher as an examiner, absolute impartiality in the attested records will be necessary. On the other hand, at the universities, where the teacher is almost always one of the examiners, no personal like or dislike of a student must influence the report of the internal to the external examiner. The class records should, of course, be available but the scheme will put a serious ethical obligation on all concerned and the Council will doubtless watch its operation with keen and critical interest.

Training in Preventive Medicine.

The first of the resolutions quoted above should be borne in mind by every teacher throughout the whole curriculum, and not merely in the clinical subjects. All the earlier subjects—physics, chemistry, biology, physiology, anatomy and, of course, pathology, bacteriology, and therapeutics also—afford opportunities from the very beginning for instilling into the mind of the student the necessity for his keeping constantly in view, in all the advice and treatment he may give throughout his professional life, the primary importance of promoting the general health of those who entrust themselves to his care, and of preventing trivial ailments from developing into definite disease.

THE GENERAL MEDICAL COUNCIL.

THE General Medical Council was established by the Medical Act, 1858, in order "that persons requiring medical aid should be enabled to distinguish qualified from unqualified practitioners." It consists of eighteen members appointed by the Universities in the United Kingdom having medical faculties; of nine members appointed by the Medical Corporations, such as the Royal Colleges of Physicians and Surgeons, of five members appointed by His Majesty in Council, and of six members directly elected by members of the profession as a whole—a total of thirty-eight. To these are added three dentists who are members of the Dental Board, and are appointed for dental business. Although the eighteen members appointed by the Universities and the five members appointed by His Majesty in Council may all be laymen, only one layman has so far been appointed, and that was by the Privy Council in 1926.

The Council's offices are at 44 Hallam Street, Portland Place, London, W.1, and it has Branch Offices at 12 Queen Street, Edinburgh, and 35 Dawson Street, Dublin.

The Council exists for the protection of the public and not of the profession. Its principal functions are three. First, to keep the *Medical Register* second to see that the name of no person is entered thereon as qualified unless he has had an adequate professional education, and to remove therefrom the names of qualified persons who are no longer entitled to public confidence, and third, to provide for the publication of the *British Pharmacopœia*. It is the appearance of a name upon the *Medical Register*, and not the possession of a degree or diploma, that constitutes a person a duly or legally qualified practitioner of medicine.

The Council has no power to make rules in regard to the medical curriculum or examination, but it can pass resolutions and make recommendations relating thereto, and, if any of these were ignored by the licensing bodies, it would be open to the Council to make representations to the Privy Council, which, if it thought fit, might order that the qualifications obtained from such bodies should not be registrable.

The name of any medical practitioner who has been convicted of felony or misdemeanour, or who is proved before the Council itself to have been guilty of "infamous conduct in a professional respect," may be erased from the *Medical Register*.

The Medical Acts prohibit attempts being made to impose restriction as to any theory of medicine or surgery, and, once a practitioner has been trained and tested in the knowledge essential for public safety, he may adopt any "theory" of medicine or surgery in which he honestly believes. The Medical Acts do not prohibit the practice of medicine by unregistered persons, but if they "wilfully and falsely" assume any title implying registration they are liable to prosecution. In this respect the Medical Acts differ from the Midwives and the Dentists Acts, which

3. A candidate remitted in any subject of a professional examination should, before he is readmitted to examination therein, be required to produce satisfactory evidence that he has, during the interval of remission, pursued the study of the subject in which he was rejected. Candidates who obtain less than 30 per cent. of the marks in any subject should be remitted for a longer period than three months.

4. In all the professional examinations sufficient time should be assigned to practical work, in order to test the thoroughness of the candidate's knowledge and to encourage practical methods of study.

5. Candidates in all their examination work should be carefully supervised.

6. Two examiners should always participate in the oral examination of a candidate, except in subordinate parts of practical examinations.

7. In all written examinations the questions in each subject should be submitted for the approval of all the examiners in that subject.

8. In all written examinations an average of at least half an hour should be allowed for a candidate to answer each question.

9. It is desirable that examiners, and in particular those for the Final Examination in medicine, surgery, and midwifery, should be appointed or re-elected for at least three consecutive years.

10. Whatever may be the system of marking, the percentage for a pass in each subject should not be less than 50.

11. In the regulations for the several examinations it should be provided that examiners, in assessing marks, be empowered to take into account the duly attested records of the work done by the candidate throughout his course of study in the subject of the examination.

12. The Final Examination in medicine, surgery, and midwifery, with the exception of the clinical and practical examination in midwifery and gynaecology, must not be passed before the close of the fifth academic year of medical study.

13. The three portions of the Final Examination in medicine, surgery, and midwifery should not be further subdivided into sections which may be entered for or passed separately.

14. Compensation in respect of marks as between the three different portions of the Final or Qualifying Examination—namely, medicine, surgery, and midwifery—is contrary to the intention of the Medical Act (1886).

15. The Final Examination should include clinical and practical examinations in midwifery and gynaecology.

16. The clinical examination in medicine, surgery, and midwifery should be held in properly equipped hospitals or examination halls well provided with suitable patients.

17. In the examinations in clinical medicine at least one hour, and in clinical surgery at least half an hour, should be allowed to the candidate for the examination of, and report on, his principal case.

18. In medicine, in surgery, and in midwifery, no candidate should be allowed to pass who fails to obtain 50 per cent. of the aggregate marks assigned to the whole examination; or who fails to obtain 50 per cent. of the marks assigned to the clinical examination; or who fails to obtain 40 per cent. of the aggregate of the marks assigned to the written and oral examination. In midwifery, where a clinical examination is not held, the duly attested records of the work done by the candidate in clinical midwifery must be presented to the examiners for assessment in the Final Examination; and no candidate should be allowed to pass who fails to obtain 50 per cent. of the aggregate marks assigned to clinical and practical midwifery and gynaecology.

19. The Final Examination should include the examination of secretions, the testing of urine, clinical microscopy, and prescription writing, and there should always be an oral examination in medicine, surgery, and midwifery, which should include an examination on pathological specimens.

20. At the Final Examination each candidate should be submitted to a practical and oral examination in pathology (macroscopic and microscopic), unless this has been included in a professional examination preceding the Final Examination.

21. Whatever be the method of entry for the Final Examination all candidates should be required to complete the three portions of the Final Examination within a period of nineteen months.

This section of the Educational Number would be incomplete without brief mention of the memorandum, drawn up by the Registrar of the General Medical Council, on the procedure to be adopted by those who desire to enter the profession of medicine, to which reference is made in the introductory article at page 347. This pamphlet (price 1s. post free) sets out in plain language the information for which the Registrar is often asked by prospective medical students or their guardians.

Universities in England and Wales.

THERE are eleven universities in England and Wales, and some account of each of them follows. They all have now fully developed medical faculties.

UNIVERSITY OF OXFORD.

THE professional degrees conferred by this university are those of Bachelor of Medicine (B.M.), Bachelor of Surgery (B.Ch.), Doctor of Medicine (D.M.), and Master of Surgery (M.Ch.). It also grants a diploma in public health and a diploma in ophthalmology. On receiving the B.M. the candidate is entitled to registration by the General Medical Council. In favourable circumstances this degree and the B.Ch. may be obtained in six or seven years from matriculation. Before receiving either, the candidate must have taken a degree in arts (B.A.), for which three years' residence within the university is necessary. This, however, does not necessarily mean deferment of professional study for that period, for the subjects chosen for the arts course may be to a great extent the same as those in which examinations would in any case have to be passed for the medical degree, and the courses are dovetailed together.

In accordance with a statute which came into force on October 7th, 1920, women may be matriculated and admitted to degrees in the university. The statute is retrospective under certain conditions. Before matriculation a woman must have been admitted as a member of one of the five societies of women students (Lady Margaret Hall, Somerville College, St. Hugh's College, St. Hilda's Hall, or the Society of Oxford Home Students). Women members of the university are admitted to all degrees, except those in divinity, under the same conditions as those laid down for men in regard to examinations, courses of study, and fees, and under corresponding conditions as to residence at the university. Among the university diplomas open to women are those in anthropology, ophthalmology, and public health.

There are numerous avenues to the B.A. degree, but that which constitutes the *normal* course for medical students, as being the most closely related to their medical studies, is the following: By passing Responsions (or one of the examinations which are accepted as equivalent), the Scripture examination, some of the preliminary examinations in the Natural Science School,[1] in the first public examination; and one of the final honour examinations in the Final Honour School of Natural Science—physiology being that usually taken.

Responsions and the preliminary examinations in natural science may be passed before a candidate is a member of the university[2]; a Final Honour School may be taken at the end of the third or fourth academical year—that is, within nine or twelve terms respectively; the preliminary examinations of the Natural Science School may be taken as soon as Responsions has been passed or exemption obtained.

PROFESSIONAL DEGREES.

To obtain the B.M., B.Ch. degrees the candidate must first pass in four of the subjects of the preliminary examination of the Natural Science School—namely, physics, chemistry, zoology, and botany.

He then has two further examinations to pass—the First B.M. and the Second B.M. These take place twice a year, the first on the Thursday, the second on the Wednesday, of the eighth week of Michaelmas and Trinity terms. Every candidate at the first B.M. is examined in human anatomy, in physiology, and in organic chemistry, but is excused from physiology if he has obtained a first or second class in the Honour School of Physiology, and from organic chemistry if he has satisfied the examiners in Part I of the Honour School of Chemistry. Once he has passed this examination he can, on production of certain certificates, be examined as soon as he pleases in pathology, forensic medicine and hygiene, materia medica, and

[1] The four subjects of the medical preliminary examinations are four of the subjects in the natural science preliminary, and can be commenced directly after passing Responsions.

[2] Membership is constituted by Matriculation and by becoming either a member of a College or a Hall or a non-collegiate student.

pharmacology (subjects of the Second Examination), but cannot present himself for the remaining subjects—medicine, surgery, and midwifery—until the eighteenth term from the day of his matriculation *unless he be already a registered medical practitioner*, and not until a period of at least thirty-three months has elapsed from the date of his passing the First Examination, and he must pass in all the three subjects at one and the same time.

Before admission to the Second B.M. examination the student must produce certificates of instruction from a medical school recognized by the university, of having acted as clinical clerk and dresser, each for six months, and as post-mortem clerk for three months, of attendance on labours, of instruction in infectious and mental diseases and ophthalmology, and of proficiency in vaccination and the administration of anæsthetics,[1] and of three academic years of hospital attendance. He must also produce certificates of attendance in laboratory courses in pathology, bacteriology, and pharmacology, either in Oxford or in a recognized medical school.

D.M. AND M.CH. DEGREES

A Bachelor of Medicine who wishes to proceed to the D.M. must have entered his thirtieth term and must present a dissertation for approval by the appointed examiners on a subject previously approved by the Regius Professor of Medicine. If a candidate for the M.Ch. he must have entered his twenty-first term and must pass an examination, which is held in June.

D.P.H. AND D.O.

Examinations for the diploma in public health have been suspended until further notice, that for the diploma in ophthalmology is held annually in March

TEACHING.

The several colleges provide their undergraduate members with tutors for all examinations up to the B.A. degree. In addition, the university provides certain courses of instruction, including lectures, demonstrations, and practical work, which cover all the subjects of the Preliminary Examination and First B.M., and those of the Final Examination.

SCHOLARSHIPS

Most colleges grant scholarships, open to intending medical students of the maximum value of £100 a year, tenable for four years, in natural science, chemistry, physics, and biology. Exhibitions of varying value are also awarded in these subjects. At two colleges (University and Pembroke) there are medical entrance scholarships of £100 a year. Particulars can be obtained on application to the college tutors. Scholarship for women are also offered by the various women's college, from the principals of whom details of the examinations may be obtained. A Radcliffe Travelling Fellowship of £300 a year, tenable for two years, is conferred annually; candidates must have taken the B.M. degree. A Schorstein Research Fellowship of £200 a year for two years is awarded biennially. The Fellow must engage in research in one of the Medical Departments of the University. A George Herbert Hunt Travelling Scholarship of about £100 is awarded biennially to enable a young medical graduate to spend three months abroad in medical study. A Philip Walker Studentship in Pathology of £200 a year, tenable for two years, is awarded biennially for the encouragement of research in pathology, as also are the Rolleston Memorial Prize and the Radcliffe Prize (£50), for research in natural science (including pathology), and the three Theodore Williams Scholarships in Anatomy, Physiology, and Pathology, of the value of £50 each, tenable for two years. A Radcliffe Scholarship in Pharmacology of £50 for one year, open to the University, is awarded annually by the Master and Fellows of University College. A Burney Yeo King's College Hospital Scholarship of £60 is awarded annually.

FEES

An annual fee of £4 10s. is paid to the university for the first four years, being reduced to £1 when the B.A. has been taken. For the degree the fees are: the B.A., £7 10s.; the B.M. and B.Ch., £14; the D.M., £25; the M.Ch., £12. College fees, varying in amount, are paid for the first four years of membership and in taking degrees. Tuition fees vary from £21 to £30. The minimum annual cost of living during the three university terms may be regarded as not less than £200, or for women not less than £140.

For further information application may be made to Dr. E. W. Ainley Walker, Dean of the School of Medicine, University of Oxford.

[1] For the certificates that will be required from candidates amenable to the new Regulations of the General Medical Council, see *Examination Statutes*, Clarendon Press, Oxford, 1930 edition.

UNIVERSITY OF CAMBRIDGE

The professional degrees given by this university are those of Bachelor of Medicine (M.B.) and Bachelor of Surgery (B.Chir.), each of which entitles the possessor to admission to the *Register* by the General Medical Council, and the higher degrees of Doctor of Medicine and Master of Surgery. It also grants diplomas in tropical medicine and hygiene, in public health, in hygiene and in medical radiology and electrology to medical practitioners, not necessarily graduates of the university. Information regarding these diplomas will be found in later sections under the headings Tropical Medicine, Public Health and Radiology. A candidate for the M.B., B.Chir. degrees need not possess a degree in arts: it is sufficient if he has passed the Previous examination or some other examination accepted by the university as its equivalent. Most students, however, are advised to take the B.A. degree preferably by obtaining honours in the Natural Sciences Tripos. The attainment of a sufficient standard in certain subjects in this Tripos will secure exemption from the corresponding tests in the First and Second M.B. examinations in the case of students who take up medical study late in their university career. Members of Girton College and Newnham College are admitted to the examinations.

PROFESSIONAL EXAMINATIONS

To obtain the M.B. degree the candidate must pass three examinations and keep an Act. The B.Chir. degree (which is a registrable qualification) may be obtained after passing all three examinations.

First M.B.—This comprises (1) general and inorganic chemistry, (2) mechanics, (3) physics, (4) elementary biology. The parts may be taken together or separately. In either case the candidate, before admission to examination must have passed or been exempted from the Previous Examination. Certain exemption from the First M.B. Examination are allowed, the regulations may be obtained from the Registrary. The examination is held three times in the year.

Second M.B.—This examination comprises Part I, organic chemistry, Part II. human anatomy and physiology, Part III. elementary pharmacology including pharmaceutical chemistry and the elements of general pathology. No student is admitted to the first part of the Second Examination until he has completed the Previous Examination and the first part of the First Examination. No student is admitted to the second part of the Second Examination until he has passed all parts of the First Examination and has been matriculated. No student shall be admitted to the third part of the Second Examination until he has passed the first and second parts of the Second Examination. The candidate must present certificates of study in the subjects of the second and third parts. The examinations for Part I are held in October, December, and June, and for Part II in December and June; that for Part III in October and April.

Third M.B.—This is divided into two parts, to neither of which the candidate is admitted until he has passed the examinations previously mentioned. A candidate for the first part, which deals with the principles and practice of surgery (including special pathology) and midwifery and diseases peculiar to women, must have completed five years of medical study and be signed up in these subjects and have completed two years and a half of hospital practice. Before admission to the second part the candidate must have completed five years of medical study, and be duly signed up in all subjects and have completed three years of hospital practice. The examination is in the principles and practice of physic (including diseases of children, mental diseases, and medical jurisprudence) pathology (including hygiene and preventive medicine) and pharmacology (including therapeutics and toxicology). The Third M.B. examinations are held twice a year—in June and December.

Act for the M.B.—Before receiving his M.B. degree a candidate who has passed the Third M.B. examinations has to write a thesis. This he reads in public on an assigned day, and is then questioned concerning it and other subjects of medicine by the Regius Professor of

Physic. If approved at this test he is then certified as having "kept the Act," and in due course receives his degree. Medical degrees may be taken in absence by those living abroad, the candidate sending to the Registrar a dissertation, which is laid before the Degree Committee.

THE HIGHER DEGREES.

The M.D. degree may be taken by a Bachelor of Medicine of three years' standing (and a Master of Arts of four years' standing who has completed the course required for M.B.) after writing a thesis approved by the M.D. Degree Committee, and keeping a further Act, at which he reads his thesis and is examined thereon. Previously to the Act being kept a topic taken from the general subject of his thesis (whether it be physiology, pathology, pharmacology, practice of medicine, State medicine, or the history of medicine) is submitted to the candidate, on which he is required to write an extempore essay.

A candidate for the M.Chir. degree who is an M.A. may be admitted to the examination after he has become legally qualified to practise surgery. Other candidates may be admitted when two years have elapsed after they have passed the Third M.B. Examination. The examination comprises pathology, surgery, surgical anatomy, and surgical operations. The tests are partly in writing, partly oral, and partly practical: they include the writing of an extempore essay. Proposals are before the university whereby the examination will be held in February in each year.

FEES.

In addition to college fees, tutorial fees, and the expense of living, the following examination fees are payable: First M.B., £5 5s.; Second M.B., £6 6s.; Third M.B., £10 10s. For schedules referring to the examinations, lists of schools recognized by the university, and other information, application should be made to the University Registrary, Cambridge.

UNIVERSITY OF LONDON.

UNDER the regulations of the University of London the degrees obtainable in the Faculty of Medicine are those of Bachelor of Medicine and Bachelor of Surgery, Master of Surgery in four branches, Doctor of Medicine in six different branches, Bachelor of Dental Surgery, and Bachelor of Pharmacy. The university has its own matriculation examination, and it is very advisable that candidates should obtain and carefully study the booklets relating to it. The matriculation examination is open to any person, of either sex, who has attained the age of 16. It is held in January, June, and September, and lasts four days; the first two take place both in London and in certain provincial centres; the September examination is held in London only.

In no circumstances is a degree granted to anyone in less than three years after the date at which he passed the matriculation examination or obtained registration in some other way; and, unless they are already registered medical practitioners of a certain age and standing, all medical students must pass not less than five and a half years in professional study subsequent to matriculation, of which the last three years must be spent at a school of advanced medical studies.

PROFESSIONAL EXAMINATIONS.

M.B., B.S.—There are three examinations, the last two being subdivided. They are held twice a year.

The First Examination (held in July and December) covers inorganic chemistry, general biology, and physics, there being two papers, a practical test, and a possible oral test in each subject. The names of successful candidates are placed in alphabetical order with a note as to any subject in which a candidate has distinguished himself or herself.

The Second Examination is held in March and July. Part I covers organic chemistry, the candidate's knowledge being tested as in the earlier examination. Candidates for Part II must have passed the First Examination at least eighteen months previously, besides having completed Part I of the Second Examination. The subjects are anatomy, physiology, and pharmacology, the tests being written, oral, and practical. Candidates who fail in pharmacology may sit for re-examination in that subject alone if the examiners think fit, and candidates who pass in pharmacology only may similarly be credited with that subject.

No candidate, unless he is already a registered medical practitioner, is admitted to the Third M.B., B.S. Examination within three academic years from the date of his completing the Second Examination. The subjects are medicine (including mental diseases), pathology, forensic medicine and hygiene, surgery, and obstetrics and gynaecology. They may be divided into two groups, one comprising medicine, pathology, forensic medicine, and hygiene, and the other surgery and obstetrics and gynaecology. Either group may be taken first at the option of the candidate, or the groups may be taken together. Only candidates who show a competent knowledge of all the subjects comprising a group are passed. There is no separate examination held for honours, but the names of successful candidates are divided into an honours list and a pass list, and a university medal may be awarded the candidate who has most distinguished himself in the whole examination.

THE HIGHER DEGREES.

M.D.—An examination for the M.D. is held twice yearly—in December and July. Every candidate must have passed the examination for the M.B., B.S., unless he became M.B. before May, 1904. He may present himself for examination in any one of the following branches: (1) medicine, (2) pathology, (3) mental diseases and psychology, (4) midwifery and diseases of women, (5) State medicine, (6) tropical medicine, and, if he wishes, may pass also in another branch at a subsequent examination.

The period that must elapse between acquiring the M.B. and sitting for the M.D. in any branch varies between one and two years, according to the nature of the candidate's previous work, and in all cases evidence must be afforded of special study of the subject chosen; both written and practical examinations must be passed, though exemptions can be obtained from the former in exceptional circumstances. In each branch the scheme of examination is the same: two papers on its special subject, a paper on an allied subject—for example, medicine in the case of branch (4), pathology in branch (1)—an essay on one of two suggested topics connected with the special subject, and a clinical or other practical test. In any branch of the M.D. Examination a gold medal of the value of £20 may be awarded.

M.S.—The regulations with regard to the Mastership in Surgery are of a corresponding kind, but there are four branches in which it may be obtained—general surgery, dental surgery, ophthalmology, and laryngology, otology, and rhinology.

FEES.

For Matriculation: 2½ guineas for each entry. First Examination: 6 guineas for each entry to the whole examination. For re-examination in one subject the fee is 2 guineas. Second Examination, Part I: 3 guineas for the first and each subsequent entry. Second Examination, Part II: 9 guineas for each entry to the whole examination. For re-examination in one subject the fee is 4 guineas. M.B., B.S. Examination: 12 guineas for each entry to the whole examination, and 6 guineas for examination or re-examination in either group. M.D. and M.S. Examinations: 20 guineas, and 10 guineas on re-examination.

Inquiries should be addressed to the Academic Registrar, the University of London, South Kensington, S.W.7.

UNIVERSITY OF BIRMINGHAM.

THIS university confers medical and surgical degrees—namely, M.B., Ch.B., M.D., and Ch.M.—and also diplomas and degrees in State medicine and dentistry. The M.B., Ch.B. candidate may also combine with the earlier part of his medical curriculum courses leading to the ordinary B.Sc. degree in anatomy and physiology. The degree of B.Sc. with honours in one of these subjects requires an extra year. The full course of study for the degrees of M.B., Ch.B. extends over six years. The Senate has power to accept courses of study and examinations passed at other recognized universities as exempting from the examinations in physics, chemistry, biology, and organic chemistry. In the case of such students at least three years must be spent in attendance upon classes at the university. A degree of Ph.D. is also conferred for research

study in medicine under special regulations. Candidates must be graduates in medicine of a recognized university.

Students entering the Medical Faculty for the M.B., Ch.B. degrees must have passed—

(1) Either (*a*) the matriculation examination of the Joint Board of the Universities of Manchester, Liverpool, Leeds, Sheffield, and Birmingham; or (*b*) some other examination recognized as equivalent to the matriculation. Candidates for medical degrees are required to have passed in English literature and mathematics, and are recommended to take *Latin and a science subject—chemistry or physics—at the* matriculation examination. The matriculation examination of the Joint Board is held in July and September. The regulations and the list of examinations accepted in lieu thereof will be sent on application to the Secretary to the *Board, Joint Matriculation Board*, 315, Oxford Road, Manchester.

(2) A recognized pre-registration examination in the subjects of chemistry and physics—for example, the higher school certificate of the Joint Matriculation Board, or a candidate may attend first-year courses in the university, October to June, taking chemistry and physics, and biology.

PROFESSIONAL EXAMINATIONS.

The candidate for the M.B., Ch.B. degrees has five examinations to pass. In the Second (Part II) and Final examinations the candidate must pass in all the prescribed subjects or undergo the whole examination again.

The First M.B. deals with physics, chemistry, and biology. The Second M.B. (Part I) deals with organic chemistry. The Second M.B. (Part II) deals with anatomy and physiology, and the student must pass in both simultaneously. The Third M.B. deals with pathology and bacteriology. The Fourth M.B. takes place at the end of the fifth year, the subjects being forensic medicine, toxicology, public health, materia medica, pharmacology, and therapeutics.

Final M.B.—This comprises medicine, surgery, midwifery and diseases of women, ophthalmology, and mental diseases. The candidate, in addition to more ordinary certificates, must be prepared with a certificate of having acted as a *post-mortem clerk for three months, and received special* instruction in anæsthetics and clinical instruction in diseases peculiar to women, asylum ward work, ophthalmology, children's diseases, venereal diseases, ear and throat and skin diseases, etc. In respect to ophthalmology he must show that he has learnt refraction work. He also has to present to the examiners at the time of his examination a short written commentary on a gynæcological subject or case investigated during the period of gynæcological clerking.

M.D.—An ordinary candidate for this degree must be a M.B., Ch.B. of not less than one year's standing. He presents an original thesis for approval, and then passes a general examination in the principles and practice of medicine. From the latter the Board of Examiners may exempt a candidate whose thesis is of exceptional merit. The regulations respecting the Ch.M. are of the same general character. Subject to certain requirements as to special research or other post-graduate study, graduates of other universities may obtain the M.D. and Ch.M. in the same way as holders of the Birmingham M.B., Ch.B.

FEES.

The fee for Matriculation is £2 (payable to Joint Matriculation Board); £2 10s. for First M.B. Examination (if taken in university), and £2 10s. for each of the first four Professional Examinations; M.B., Ch.B. degree fee, £10, M.D. and Ch.M. Examinations, £12 10s. each. For further particulars application should be made to the Dean of the Medical Faculty, University of Birmingham.

UNIVERSITY OF BRISTOL.

IN the Faculty of Medicine the following degrees are conferred: Bachelor of Medicine and Bachelor of Surgery (M.B. and Ch.B.), Doctor of Medicine (M.D.), Master of Surgery (Ch.M.), Bachelor of Dental Surgery (B.D.S.), and Master of Dental Surgery (M.D.S.). There are also the following diplomas: diploma in public health (D.P.H.), diploma in dental surgery (L.D.S.), and diploma in veterinary State medicine. All candidates for degrees in medicine, surgery, and dentistry are required to reach matriculation standard in the school certificate examination, or to pass such examination as may be regarded as equivalent by the Senate. All courses, degrees, and diplomas are open to men and women alike.

Conjoined Degrees of Bachelor of Medicine and Bachelor of Surgery.—Candidates must be not less than 21 years of age and have pursued the courses prescribed by university regulations during not less than five years after passing the First Examination in chemistry and physics, of which three shall have been spent in the university, and two of these three subsequent to passing the Second Examination. All candidates for the degrees of M.B., Ch.B. are required to satisfy the examiners in the several subjects of three examinations.

The First Examination.—The subjects of examination are: chemistry (inorganic), physics, and biology, the courses pursued being those for the time being approved for the intermediate part of the B.Sc. curriculum. This part of the curriculum shall extend over one year. (Candidates who have passed the higher school certificate approved by the Board of Education in these subjects will not be required to sit for the First Examination and will be regarded as having completed one year of study.)

The Second Examination.—The subjects of examination are: organic chemistry and elementary anatomy (Part I) and advanced anatomy and physiology (Part II).

The Final Examination.—The subjects of examination are: materia medica and pharmacy, pharmacology and therapeutics, general pathology, morbid anatomy, and bacteriology (Part I); special pathology, forensic medicine, toxicology, and public health, obstetrics (including diseases of women), surgery (systematic, clinical, practical, and operative, including ophthalmology and oto-rhino-laryngology), medicine (systematic, clinical, and practical, including mental diseases) (Part II). The subjects included in Part II may be taken in two groups—namely, Group I: surgery and obstetrics; Group II: medicine public health, special pathology, forensic medicine, and toxicology. Candidates may pass Parts I and II together or separately, and the two groups of Part II may likewise be taken together or separately, but no student can obtain honours who elects to take the two groups of Part II separately. Forensic medicine and toxicology may be taken either with Part I or with Group II of Part II.

Degree of Doctor of Medicine.—Candidates must be Bachelors of the university of not less than two years' standing as such, and may elect either (1) to pass an examination in general medicine, or (2) to pass an examination in State medicine, or (3) to present a dissertation. The candidate who elects to pass the examination in State medicine must hold a diploma in public health of some university or college, and the candidate who elects to present a dissertation may be examined in the subject thereof.

Degree of Master of Surgery.—The degree may be taken in general surgery or in special subjects. Candidates shall be Bachelors of not less than two years' standing as such. For general surgery, they shall pass an examination in surgical anatomy, pathology, and bacteriology, and in operative, clinical and general surgery, and shall present a dissertation. For special subjects—that is, ophthalmology or oto-rhino-laryngology or gynæcology—they shall, in addition to having studied and practised for two years the subject concerned, have held an approved appointment in it for not less than six months, they shall pass a written, oral, and clinical examination in the branch of surgery concerned, as well as in the anatomy, physiology, and pathology of the region of the body concerned (including, in the case of ophthalmology, physiological optics), and also a written examination in the principles of general surgery.

Diploma in Public Health.—Candidates must be at least 23 years of age, be fully registered medical practitioners of not less than two years' standing as such, and have passed the examination prescribed by regulation. The examination is divided into two parts.

UNIVERSITY OF DURHAM.

To its own undergraduates, who may be of either sex, this university grants the degrees of Bachelor of Medicine and Bachelor of Surgery (M.B., B.S.), and Doctor of Medicine (M.D.), Master of Surgery and Doctor of Surgery (M.S. and D.Ch.), Bachelor of Hygiene, Doctor of Hygiene, and Bachelor of Dental Surgery and Master of Dental Surgery (B.D.S. and M.D.S.); it also grants diplomas in public health, psychiatry, and dental surgery. The university accepts the Durham University school certificate examination (if a sufficient standard is obtained in certain specified subjects) for matriculation purposes, but also accepts the tests of a considerable number of other educational bodies as a full or partial equivalent. A list may be obtained on application. In addition to satisfying the matriculation requirements of the university, every student must (1) pass a pre-registration examination in physics and inorganic chemistry conducted or recognized by the university, and (2) be registered on the books of the General Medical Council. To become a graduate, however, at the university it is not necessary to pass the major portion of the five years' curriculum within its precincts. It is sufficient if, before he presents himself for his final examination, the candidate has spent at least one year in study at the University of Durham College of Medicine, Newcastle-on-Tyne, including the practice of the Royal Victoria Infirmary in the same city. The earlier examinations may be passed while the student works elsewhere.

PROFESSIONAL EXAMINATIONS.

There are four professional examinations for the M.B., B.S. degrees. *The First, Second, and Third examinations* are held in March and June, and the Final Examination in June and December. The first deals with biology and organic chemistry; the second with anatomy and physiology; the third with pathology, bacteriology, materia medica, pharmacology, general principles of therapeutics, and pharmacy, medical jurisprudence, and public health. At the Final M.B., B.S. the candidate is examined in medicine and clinical medicine; surgery and clinical surgery; midwifery and diseases of women and children; clinical and practical midwifery and gynaecology; and clinically in psychological medicine, diseases of the throat, nose and ear, diseases of the skin, diseases of the eye, and diseases of children.

M.D.—A Bachelor of Medicine who wishes to proceed to this higher degree must be of at least two years' standing, and must comply with the regulations printed in the Calendar of the College of Medicine. If the candidate is not an M.B. of the university, he must be a practitioner of fifteen years' standing, 40 years of age, and submit to special tests. (See under Degrees for Practitioners, p. 402.)

M.S.—Candidates for this degree must have been engaged in practice for at least two years subsequent to becoming M.B., B.S.Durham. They are submitted to an examination which covers the whole range of surgical knowledge.

D.Ch.—The university grants also the degree of Doctor of Surgery. Candidates for this degree must be registered medical practitioners, not less than 24 years of age. They must devote three years, subsequent to obtaining a registrable qualification, to the study of surgery and ancillary subjects; one at least of the three years must be spent in the university. The candidate must submit to the professor of surgery the course of study he proposes to follow, and his course must be approved by the Board of Faculty of Medicine.

One year must be devoted mainly to work in the departments of anatomy, physiology, pathology, and bacteriology, and the candidate must submit evidence of having so worked. Not less than six months of another year must be spent as a resident surgeon in a recognized teaching hospital, and the rest of the year in the study of surgery in a recognized medical centre. Not less than six months of one of the three years must be spent in surgical study abroad.

Degree of Bachelor of Hygiene and the D.P.H.

No candidate is admitted to the final examination for the degree of B.Hy. unless he is a Bachelor of Medicine and Surgery, of not less than two years' standing, of a recognized university whose degrees are registrable on the books of the General Medical Council of the United Kingdom.

No candidate is admitted to the final examination for the D.P.H. unless he is a registered medical practitioner of not less than two years' standing.

The course of study for the B.Hy. and D.P.H. extends over a period of not less than twelve calendar months subsequent to the attainment of a qualification registrable by the General Medical Council of the United Kingdom. Candidates for the B.Hy. must attend this course at the University of Durham; candidates for the D.P.H. may attend it at the University of Durham or at any medical school or institution which is recognized by the university.

The examination for the diploma or degree consists of Part I and Part II, each of which extends over not less than two days, and is conducted by examiners specially qualified. A candidate must pass in all the subjects of Part I before being admitted to examination for Part II. In Part I, and also in Part II, a candidate must pass in all the specified subjects at one time.

The examination for Part I is practical, written, and oral, and includes the following subjects: bacteriology and parasitology (including medical entomology); chemistry and physics; and meteorology and climatology, in relation to public health. Candidates are not admitted to examination for Part I until after they have completed the prescribed courses of instruction in the subjects thereof.

The examination for Part II includes the following subjects: hygiene and sanitation (including sanitary construction); epidemiology and infectious diseases; sanitary law and vital statistics; public health administration. The examination is written and oral, and includes practical examinations in infectious diseases; food inspection, inspection of premises—dwellings, factories, workshops, schools, etc. Candidates are not admitted to examination for Part II until after they have completed the prescribed courses of instruction in the subjects thereof.

Doctor of Hygiene.

Candidates for the degree of Doctor of Hygiene must be Bachelors of Hygiene of the university of two years' standing, and are required to satisfy the examiners that they have conducted original research in the subject of public health.

Diploma in Psychiatry.

Candidates must be registered medical practitioners, and, unless qualified before January 1st, 1911, must have attended, subsequent to passing their qualifying examinations, courses of instruction in: (*a*) anatomy; (*b*) physiology; (*c*) pathology; (*d*) bacteriology; (*e*) psychology and experimental psychology; (*f*) clinical neurology; (*g*) psychiatry; (*h*) clinical psychiatry. The examination consists of two parts, namely: (1) anatomy, physiology, pathology, and bacteriology; (2) psychology and experimental psychology, neurology, and psychiatry (systematic and clinical); and candidates may present themselves for the whole examination or for either part separately.

Licence and Degrees in Dental Surgery.

L.D.S.—Every dental student must, at the commencement of his studentship, be registered in the manner and under the conditions prescribed for medical students.

The First Examination consists of three parts, which may be passed separately: Part 1, organic chemistry; Part 2, biology; Part 3, theoretical dental mechanics, dental metallurgy (theoretical and practical). Second Examination: Anatomy, physiology (including biochemistry and biophysics), dental anatomy, and dental histology. Third Examination: Pathology and bacteriology, practical dental mechanics, dental materia medica and therapeutics. Final Examination: Medicine, surgery, dental surgery and pathology, orthodontics, operative dental surgery and dental prosthetics, and anaesthetics.

A candidate before presenting himself for examination is required to furnish certificates of instruction in the required subjects, attended after registration as a dental student at recognized colleges or medical schools.

Degree of Bachelor of Dental Surgery.—1.—Students taking their complete course of instruction in the university must pass the same matriculation tests as medical students, and the same pre-registration examination in inorganic chemistry and physics. After registration students must spend five years in the university. They must attend the practice of the Newcastle-upon-Tyne Dental Hospital for not less than two and a half years; six months of this time must be devoted to the study of the higher branches of dental science. There are four examinations. The subjects of the examinations are as follows: *First:* Biology, organic chemistry, and dental mechanics and metallurgy. *Second:* Anatomy, physiology, dental anatomy, and histology. *Third:* Pathology and bacteriology, dental materia medica and therapeutics, and practical and dental mechanics. *Final:* Medicine, surgery, dental surgery and pathology, orthodontics and operative dental surgery. In this subject knowledge of a much higher standard, and more advanced practical work, are required than for the Licence in Dental Surgery.

2.—Candidates possessing a Licence in Dental Surgery of a British university must study for at least one year in the university. During such year they must (*a*) attend a course of instruction in pathology and bacteriology, and (*b*) spend at least six months in the Newcastle-upon-Tyne Dental Hospital in study and practice of the higher branches of dental science. They must also pass the third and final examinations for the degree of Bachelor of Dental Surgery.

Degree of Master of Dental Surgery.—Every candidate for this degree must be a Bachelor of Dental Surgery of the university of not less than two years' standing, and present an essay embodying original work and research in some subject connected with dentistry. He must also perform to the satisfaction of the examiners a piece of special dental work demanding a high degree of skill and experience.

The examinations are held concurrently with the medical examinations.

The practical examinations in dentistry are conducted at the Newcastle-upon-Tyne Dental Hospital.

FEES.

The following fees are payable: Matriculation, £2; Examinations, First, Second, and Third M.B., B.S., each £5; Final M.B., B.S., £15; M.D. and M.S., each £5; B.Hy., D.P.H., and D.Psy., each £10 10s.; and D.Hy. and D.Ch., each £20: First, Second, and Third L.D.S., each £3 10s., and Final L.D.S. £5.; First, Second, and Third B.D.S., each £5, Final B.D.S. £8; and M.D.S. £5. For degrees and diplomas: M.B., B.S., B.Hy., and B.D.S., each £6 6s. *plus* the sum of 10s. if it is the initial degree taken in the university; M.S. and M.D.S., each £6 6s.; M.D., D.Ch., and D.Hy., each £10; D.P.H., D.Psy., and L.D.S., each £3.

Further information may be obtained from the Dean of the College, University of Durham College of Medicine, Newcastle-on-Tyne.

UNIVERSITY OF LEEDS

The degrees granted in the Medical Faculty of this university are Bachelor of Medicine, Bachelor of Surgery (M.B. and Ch.B.), and Bachelor of Dental Surgery (B.Ch.D.). Doctor of Medicine (M.D.), Master of Surgery (Ch.M.), and Master of Dental Surgery (M.Ch.D.). It also gives diplomas in public health, in psychological medicine, in dental surgery, and in nursing.

Candidates for the M.B. must have attended courses of instruction approved by the university for not less than five years, two at least of such years having been passed in the university, at least one year being subsequent to the date of passing the first examination. They must also have matriculated by satisfying the examiners in:

I. *Either* English Composition and English Literature, *or* English Composition and History.

II. *Either* Mathematics *or* Latin.

III. } *Three* other subjects not already taken under I and II above,
IV. } chosen from the following list.
V. }

(1) English literature, (2) History, (3) Geography, (4) Greek, (5) Latin; (6) French; (7) German, (8) Some one other language approved by the Board, (9) Mathematics, (10) Mechanics, (11) Physics; (12) Chemistry, (13) General experimental science, (14) Natural history; (15) Botany.

Provided that (*a*) candidates who take Mathematics under II above must include one of the subjects 4—8, (*b*) candidates who take Latin under II above must include one of the subjects 9—15. In all cases Mathematics is a compulsory subject for admission to the Faculty of Medicine.

Exemption from the examination may be granted to applicants holding certificates of having passed examinations of a standard deemed by the Matriculation Board to be at least equal to the Board's examination.

PROFESSIONAL EXAMINATIONS.

The examinations for the M.B., Ch.B. number three. The first deals with (1) physics and inorganic chemistry, (2) biology, (3) organic chemistry. In each subject laboratory work is included, but the two parts can be taken separately. For neither can the candidate present himself until after matriculation and a period of approved work in the respective subjects.

The Second Examination.—The Second Examination consists of: Part I, materia medica and practical pharmacy; Part II, anatomy and physiology. Candidates will be allowed to pass any parts separately.

The Final Examination.—The Final Examination consists of: Part I, pharmacology and pathology and bacteriology; Part II, medicine, surgery, obstetrics, gynaecology, and clinical pathology: Part III, forensic medicine, public health, and therapeutics. Part I may be taken at the end of the second clinical year, and must be passed before Parts II and III are taken. Parts II and III may be taken at the end of the third clinical year but not before the completion of the fifth year of medical study. If taken separately Part II must be passed before Part III.

M.D.—Candidates for this degree must be bachelors of medicine and bachelors of surgery of the university and subsequently to having graduated must have completed two years of hospital practice or special study approved by the university, or four years in the practice of their profession in one or other of its various branches, six months' hospital practice or special study to count as the equivalent of one year's ordinary practice. Any subject except surgery of the medical curriculum may be chosen for the examination, but a thesis, the title of which must previously receive the approval of the Board of the Faculty of Medicine, may be submitted, and if it is adjudged to be of exceptional merit the candidate may be exempted from further examination.

Ch.M.—The candidate for this degree must have been admitted to the M.B., Ch.B. of the university not less than a year previously, and during that time must have held for at least six months a surgical appointment in a public institution affording full opportunity for the study of practical surgery. He must also have attended certain courses, including one on ophthalmology and one on pathology and bacteriology, he is then examined in surgery in all its branches and in ophthalmology and pathology and bacteriology.

FEES.

The Matriculation fee is £2, and on readmission £1 10s. For each of the other examinations £6 and £8 on readmission; Ch.M. £10 and same on readmission; M.D. £10. On conferment of the degree of Ch.M. £5 is payable, and £5 for the M.D. degree.

UNIVERSITY OF LIVERPOOL

This university, besides granting degrees in medicine (M.B. and M.D.) and in surgery (Ch.B., M.Ch.Orth., and Ch.M.), gives degrees in dental surgery (B.D.S. and M.D.S.), a degree in hygiene (M.H.), and degrees in veterinary science (B.V.Sc., M.V.Sc., and D.V.Sc.). Diplomas are awarded in dental surgery (L.D.S.), tropical medicine (D.T.M.), tropical hygiene (D.T.H.), public health (D.P.H.), veterinary hygiene (D.V.H.), and medical radiology and electrology (D.M.R.E.). The degree of Doctor of Philosophy (Ph.D.) may also be taken in the Faculty of Medicine.

MATRICULATION.

The matriculation examination is governed by the Joint Matriculation Board, 315, Oxford Road, Manchester, which accepts, under certain conditions, the tests of several other bodies as its equivalent. Candidates will be required to have included mathematics among the subjects in which they have passed at such examination.

PROFESSIONAL EXAMINATIONS.

Candidates for the M.B., Ch.B. degrees have three examinations to pass, the first including (1) chemistry, (2) biology (zoology and botany), (3) physics, (4) special chemistry.

Second M.B.—This test covers (*a*) (1) anatomy, (2) physiology, including physiological chemistry and histology; and (*b*) (3) elementary bacteriology, (4) clinical chemistry, (5) general pathology. Candidates may present themselves in (*a*) and (*b*) separately.

Final M.B.—The subjects of the Final Examination are: (*a*) (1) special pathology and morbid anatomy, (2) forensic medicine and toxicology, (3) public health, (4) pharmacology and general therapeutics, (*b*) (5) obstetrics and diseases of women, (6) surgery—systematic, clinical, operative, and practical—including ophthalmology, (7) medicine —systematic and clinical—including therapeutics, mental diseases, and diseases of children. Candidates may take Parts (*a*) and (*b*) separately, but Part (*b*) may not be taken until five years of study have been completed.

M.D.—May be conferred on graduates (M.B., Ch.B. Liverpool) (*a*) on candidates of two years' standing who present a thesis acceptable to the Faculty, together with, if candidate desires, copies of published original papers upon medical science—oral examination on subject of thesis. (*b*) on candidates of five years' standing by examination.

Ch.M.—May be conferred on graduates (M.B., Ch.B. Liverpool) after examination. Other information concerning the diplomas of this university and its medical school will be found on page 376.

FELLOWSHIPS, SCHOLARSHIPS, AND EXHIBITIONS.

The university awards Fellowships annually to students of distinguished merit, as follows:

(1) John Rankin Fellowships in Anatomy; two, each of the value of £120, tenable for two years. (2) Ethel Boyce Fellowship in Gynaecology, value £100 and tenable for one year, open to fully qualified medical students of either sex. (3) John W. Garrett International Fellowship in Bacteriology, value £100 and tenable for one year. (4) Robert Gee Fellowship in Human Anatomy, value £100 and tenable for one year. (5) Holt Fellowships in Physiology and Pathology, two in number, value £150 each and tenable for one year. (6) *Johnston Colonial Fellowship in Biochemistry*, value £100 and tenable for one year. (7) Thelwall Thomas Fellowship in Surgical Pathology, value £200 and tenable for one year. (8) Lady Jones Fellowship in Orthopaedic Surgery, one, value £200, offered every two years.

There are, in addition, scholarships and exhibitions open to medical students.

VICTORIA UNIVERSITY OF MANCHESTER.

THIS university grants the four ordinary degrees in medicine and surgery—M.B. and Ch.B. and M.D. and Ch.M.; a degree and diploma in dental surgery; a diploma in public health; a certificate in factory and in school hygiene; a diploma in psychological medicine; and a diploma in bacteriology. *Candidates for degrees must pass* the special matriculation examination prescribed by the Faculty of Medicine (or some equivalent examination accepted in lieu thereof; see the prospectus of the Joint Matriculation Board), and study at the university itself for at least two years of the six years' curriculum, subsequent to the passing of the First M.B. Examination. The matriculation examination comprises (1) Latin, (2) mathematics, (3) the English language, its literature and history, (4) mechanics, (5) one subject at choice as approved by the Joint Board. It is held in July and September.

PROFESSIONAL EXAMINATIONS.

M.B., Ch.B.—There are four examinations for this degree. They must be passed in proper order, and before admission to them the candidate must be duly certified as having attended in the subjects involved. The First M.B. is divided into Part I, chemistry and physics; Part II, biology—(*a*) botany, (*b*) zoology. The parts may be taken separately or together. At the Second M.B. the candidate is examined in anatomy (including histology) and physiology; at the third in pathology, bacteriology, and pharmacology (including materia medica and practical pharmacy). The Final Examination, under new regulations, is divided into two parts, which may be taken separately. Part I consists of (*a*) forensic medicine and toxicology, and (*b*) hygiene and preventive medicine. Part II consists of (*a*) medicine, including dermatology, diseases of children, and mental diseases; (*b*) surgery, surgical pathology, and diseases of the eye and of the ear, nose, and throat; (*c*) obstetrics and gynaecology.

M.D.—A candidate for this degree must be a Bachelor of Medicine of at least one year's standing. He has a choice between presenting an original dissertation or undergoing a written (as well as practical and clinical) examination in medicine, and a written and practical examination in pathology, and one other subject selected by himself.

Ch.M.—A candidate must have held, since becoming Ch.B., and for not less than twelve months, a post in a public institution affording opportunity for the study of the branch of surgery in which examination is desired. The examination in Branch I comprises the general field of surgery; Branch II, obstetrics and gynaecology; Branch III, ophthalmology; Branch IV, otology, laryngology, and rhinology.

B.Sc. and M.Sc.—The ordinary degree of B.Sc. in the Schools of Anatomy and Physiology may be obtained by students in medicine who in their third year of study for the degree of M.B., Ch.B. complete the additional courses in these subjects prescribed for this degree. Candidates for the Honours degree of B.Sc. in anatomy or physiology who are students in medicine are required to attend courses in advanced anatomy and physiology for four terms after passing the Second Examination for the degrees of M.B., Ch.B. Graduates in science of this university, of not less than one year's standing from the date of their graduation as Bachelors, may proceed to the degree of M.Sc. by the presentation of an approved thesis on some subject coming within the scope of the Faculty of Science.

FEES.

The following examination fees are payable: Matriculation, £2; on readmission, £2. Each M.B. examination, £8 8s.; on readmission, £3 3s. M.D., including the conferring of the degree, £15 15s. Ch.M., £10 for the examination and £10 10s. for conferment of degree. Application for further information should be addressed to the Dean of the Medical School.

UNIVERSITY OF SHEFFIELD.

THE degrees of this university (M.B., Ch.B., M.D. and Ch.M., B.D.S., and M.D.S.), and the diploma of licentiate in dental surgery, are open to candidates of either sex. Candidates for a degree must have matriculated in the university or have passed such other examination as may be recognized for this purpose, and have passed the further examination in chemistry and physics.

PROFESSIONAL EXAMINATIONS.

A candidate for the degrees of M.B., Ch.B. must produce certificates that he will have attained the age of 22 years by the day of graduation; that he has pursued the courses of study required by the university regulations during not less than five and a half years subsequent to the date of his matriculation or exception from matriculation, three of such years at least having been passed in the university, one at least being subsequent to the passing of the Second Examination. The following examinations must be passed in due order.

First Examination.—The subjects are chemistry, physics, and biology. Candidates who have passed the Intermediate Examination of the Faculty of Pure Science in any or all of the subjects of the First M.B. Examination will, on payment of the fee for the latter examination, be deemed to have passed it when they have passed in such subjects as they did not take for the Intermediate B.Sc. Examination. Candidates on presenting themselves for this examination are required to furnish certificates of having attended for not less than one year approved courses of instruction, after matriculation, in (i) chemistry, inorganic and organic; (ii) physics; (iii) biology; and of having passed or obtained exemption from the preliminary examination in chemistry and physics.

Second Examination.—The subjects are anatomy and physiology (Part I). The candidate must have passed the First Examination, and must have attended (1) courses on anatomy, including lectures and practical anatomy, during five terms; (2) courses on physiology, including lectures and practical physiology, during one year.

Third Examination.—The subjects are pathology and pharmacology, applied anatomy, and physiology. Candidates must have attended courses of instruction in pathology for five terms, in pharmacology for four terms (and one term in pharmacy), in applied anatomy for four terms, and in physiology (Part II) for six terms.

Final Examination.—The subjects are: Part I, forensic medicine and public health; candidates must have attended courses for one term in each subject. Part II, medicine (including mental diseases and diseases of children and vaccination), special pathology (including morbid anatomy and clinical pathology), and therapeutics. Part III, surgery (including the administration of anaesthetics, diseases of the ear, nose, and throat, ophthalmology, and surgical pathology), and obstetrics and gynaecology (including ante-natal and post-natal practice and infant hygiene). Candidates for Parts II and III must have completed a minimum of five and a half years of study.

M.D.—Candidates for the degree of Doctor of Medicine must have passed the examination for the degrees of M.B., Ch.B. at least three years previously, must present a thesis embodying observations in some subject approved by the Professor of Medicine, and must pass an examination in the principles and practice of medicine.

Ch.M.—Candidates for the degree of Master of Surgery must have passed the examination for the degrees of M.B., Ch.B. at least three years previously, and must, since taking the degrees of M.B., Ch.B., have held for not less than twelve months a surgical appointment in a public hospital or other public institution affording full opportunity for the study of practical surgery. The subjects of examination

FEES.

The fee for the *Pre-Medical Examination* is four guineas, for re-examination in Chemistry two guineas, for re-examination in Physics one guinea, and for Biology one guinea. The fee for the *First Professional Examination* is ten guineas, for re-examination after rejection in Section I six guineas, for re-examination after rejection in either part of Section I three guineas, for re-examination after rejection in Section II three guineas. The fee for admission to Section I of the *Final Professional Examination* is four guineas, for admission to Section II, Part I, ten guineas; Part II, ten guineas; Part III, six guineas; and the re-examination fees are respectively three guineas, six guineas, and four guineas.

ROYAL COLLEGE OF PHYSICIANS OF LONDON.

THIS College has three grades—its Licentiates, its Members, and its Fellows. The Licence is now only issued through the Conjoint Board. The Membership (examinations for which are held in January, April, July, and October) is only granted to those who have obtained the Licence, or to those who are registered practitioners and graduates of a recognized university; in any case they must be persons over 23 years of age. Candidates are examined in pathology and the practice of physic, partly in writing and partly viva voce; they are also examined in Latin, Greek, French, and German. The languages are not compulsory, but credit is given to those who show a knowledge of them. The fee for the Membership is £42, or in the case of a Licentiate £21. There is a fee of £10 10s., payable before entrance to the examination, which in the case of successful candidates is reckoned as part of the Membership fee. The body of Fellows is maintained by election from among the Members.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.

THIS College has two grades—Members and Fellows. The Members are admitted as stated in the section dealing with the Conjoint Board. The Fellowship is granted after examination to persons at least 25 years of age who have been engaged in professional studies for six years. There are two examinations for the Fellowship—the first in anatomy and physiology, held in the months of June and December, which may be passed after the third winter session; the second held in the months of May and November, chiefly directed to surgery, which may be passed after six years of professional study. Candidates must pass the Final Examination of the Examining Board in England and be admitted Members of the College before admission to the Second Examination for the Fellowship, except in the case of graduates in medicine and surgery of not less than four years' standing of universities recognized by the College for the purpose, who are required to attend for one year the surgical practice of a general hospital recognized by the College after obtaining their degrees, which must be registrable in this country.

Fees.—At First Examination, £8 8s.; for re-examination, £5 5s. At Second Examination, £12 12s. Admission fee £10 10s. for members, £31 10s. for non-members.

SOCIETY OF APOTHECARIES OF LONDON.

THIS body confers a registrable diploma in medicine, surgery, and midwifery, now known as the L.M.S.S.A. (Licentiate in Medicine and Surgery of the Society of Apothecaries), on those successful at the following examinations:

Pre-medical Examination.—Chemistry and chemical physics, and elementary biology.

Primary Examination.—This includes anatomy, physiology, and histology, and materia medica and pharmacy. Candidates will be excused any or all the subjects of the Primary Examination on producing evidence that they have passed equivalent examinations before an examining body recognized by the Society. Candidates referred in anatomy will be required to produce evidence of further work in the dissecting room before being admitted to re-examination.

Final Examination.—This is divided into three parts. Part I includes clinical surgery, the principles and practice of surgery, surgical pathology, operative manipulation, surgical anatomy, instruments and appliances. Part II includes clinical medicine: (*a*) the principles and practice of medicine (including therapeutics, pharmacy, and prescriptions), bacteriology, pathology, and morbid histology; (*b*) forensic medicine, hygiene, theory and practice of vaccination, and mental diseases. Part III includes clinical midwifery, gynaecology, and diseases of newborn children, obstetric instruments and appliances.

The fee for the Primary Examination is £5 5s.; for the Final, £15 15s. The regulations and synopses relating to the several examinations, and other information, may be obtained from the Registrar, Apothecaries' Hall, Blackfriars, E.C.4.

Mastery of Midwifery.

The Society has recently instituted a Mastery of Midwifery, and issues a diploma under this title denoting the possession of specialized knowledge of ante-natal care, midwifery, and child welfare. The examinations take place in May and November, and candidates are required to submit certificates, etc., fourteen days before date of examination. It is intended to impose a severe test so as to ensure a high standard of professional knowledge, but the diploma will not be registrable under the Medical Acts. Admission is open to all who have been for not less than a year in possession of a registrable medical qualification, and who have had certain prescribed experience at recognized institutions concerned with obstetrics, ante-natal work, and child welfare work. Special conditions apply, until 1932, to practitioners of ten years' standing. The entrance fee for the examination is £10 10s., and a further fee of £10 10s. is payable by successful candidates before admission to the Mastery. Copies of the regulations may be obtained from the Registrar at the address given in the preceding paragraph.

The Scottish Universities.

THERE are in Scotland four universities, each possessing a Faculty of Medicine, and having the right to confer degrees which admit the holder to the *Medical Register*. In essential points the regulations in their medical faculties for undergraduates are much alike, so that a general account can be given of all of them together.

The universities are those of Edinburgh, Glasgow, Aberdeen, and St. Andrews. The provision each of the cities in which these universities are situated makes for the education of medical students will be found in the section on Medical Schools in Scotland; here it need merely be said that degrees in medicine from Scotland as a whole have always enjoyed a high repute.

The degrees granted in medicine and surgery to candidates of either sex are four in number—Bachelor of Medicine (M.B.), Bachelor of Surgery (Ch.B.), Doctor of Medicine (M.D.), Master of Surgery (Ch.M.). The two former are not obtainable one apart from the other. Besides these degrees a diploma in tropical medicine and hygiene is obtainable from the University of Edinburgh, as also diplomas in psychiatry, public health, radiology, and tropical veterinary medicine. As for public health, registrable degrees in this subject are granted by the University of Glasgow, while diplomas in public health may be obtained from the Universities of St. Andrews and Aberdeen.

The conditions for admission of graduating students of medicine are the same as those in the Faculties of Arts or Science (for degrees in pure science). Prospective medical students are also required to pass a pre-registration examination in chemistry and physics.

PROFESSIONAL EDUCATION.

The regulations comply in all respects with the requirements and recommendations of the General Medical Council, and, in addition, necessitate definite study for stated periods of diseases of children, of the larynx, ear, and nose, of the skin, of ophthalmology, and of mental diseases. In respect of the various courses certificates must be obtained showing that the student has not only attended regularly, but has duly performed the work of the class. Out of the necessary five years of medical study, not less than two must be spent at the university whose degrees the student hopes to obtain, and the balance at any place officially recognized for such purpose. In each academic year there

Professional Curriculum for Candidates registered as Medical Students after October 1st, 1930.

Subsequent to registration as a medical student the candidate must pass not less than five years in medical study, each comprising a winter and a summer session. The Board does not insist that candidates shall pursue their study at any particular place, and is prepared to accept certificates of having attended the necessary courses from any recognized medical school.

Its examinations are four in number, each of them being held four times every year, and these will fall to be held three times in Edinburgh and once in Glasgow during the next period; it is open to candidates to present themselves for examination at either place. The first examination deals with general biology (systematic and practical), and physics and chemistry (systematic and practical); the second with anatomy, embryology, physiology, biochemistry and biophysics; the third with pathology (including bacteriology and morbid anatomy) and pharmacology (theoretical and practical); and the final with (1) medicine, including therapeutics, applied anatomy and physiology, and clinical pathology, with practical medicine; (2) surgery, including applied anatomy and physiology, clinical pathology, and practical surgery; (3) midwifery and diseases of women, clinical obstetrics and gynaecology, with practical midwifery; and (4) medical jurisprudence and public health. All candidates for the Final Examination must complete portions (1) (2) and (3), which must be taken together, within a period of nineteen months.

These examinations must be passed in due order, and before admission to any of them the candidate must supply certificates showing that he has completed the due periods of study of their subjects. He can present himself in any single subject of the first three examinations. As regards the Final Examination, a candidate can present himself in medical jurisprudence and hygiene at any time after completion of the third examination and of his study of these subjects; but in medicine, surgery, and midwifery he cannot present himself until the completion of five years' study, and he must take them all simultaneously. A candidate who takes up several subjects of an examination or the whole of the subjects at one time, but fails in some of them, is credited at the next examination with those subjects in which he has been approved.

Part or entire exemption from the first three examinations may be granted to those who have already passed before other bodies examinations deemed by the Board equivalent to its own, but all candidates for the Conjoint Licence must sit for the Final Examination, and at no examination can a candidate present himself within three months of his rejection by some other licensing body.

FEES.

It is estimated that the total cost of lectures and fees for the Conjoint Licence is about £170. The separate examination fees are as follows: First, Second, and Third Professional, £5 each; Final £15. On re-entry for any of the first three examinations £3, and on re-entry for the Final, £5. If the re-entry is only in one or two subjects of the First, Second, or Third Examination the fees are smaller.

Information concerning this Board should be sought either from Mr. David Thomson, 49, George Square, Edinburgh, or from Mr. Walter Hurst, Faculty Hall, 242, St. Vincent Street, Glasgow.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH.

THIS College has three grades—Licentiateship, Membership, and Fellowship—all of which are open to men and women. The regulations applying to candidates for the Licentiateship have already been generally indicated. If desirous of receiving it apart from those of the other two corporations they must be duly registered medical practitioners. Candidates will be required to pass an examination corresponding to the medical part of the Final Examination of the Conjoint Board, and conditioned in the same way, and also an examination in materia medica. The fee for examination is 15 guineas, a special examination being obtainable on due cause being shown, and on payment of 5 guineas extra. Ordinary examinations take place monthly on the first Wednesday and Thursday, except in September and October.

Candidates for the Membership must be either Licentiates of a British or Irish College of Physicians, or alternatively graduates of medicine of a university, approved by the Council, and in either case not less than 24 years of age. Candidates are examined in medicine and therapeutics, also on one or more departments of medicine specially professed, and approved by the Council, in which a high standard of proficiency will be expected. The fee to be paid by a candidate for the Membership is £36 15s. The examination is held quarterly, on the second Tuesday and following days of the months of January, April, July, and October, and application for admission to it must be made a month previous to the date at which it is proposed to appear.

For the Fellowship the candidate must have been a Member of the College for at least three years, and, if accepted, pay fees, including £25 stamp duty, amounting altogether to £64 18s. Further details can be obtained on application to the Secretary of the College.

ROYAL COLLEGE OF SURGEONS OF EDINBURGH.

THIS College has two grades—its Licence and its Fellowship. Licentiates may be of either sex, and for the Fellowship women are eligible also.

Licence.

As an original qualification the Licence is only granted after fulfilment of the regulations of the Scottish Conjoint Board, but as an additional qualification it can be obtained by those already possessed of a registrable or equivalent qualification in medicine. In this case the candidate has to pass a written, oral, and clinical examination in surgery and surgical anatomy, and may be asked to operate on the dead body.

The fee is £15 15s., of which £10 10s. is returned to unsuccessful candidates. On due cause being shown, a special examination may be granted, the fee being £20, of which £10 is returned to a candidate if he is not approved.

Fellowship.

Candidates for the Fellowship must be not less than 25 years of age, and have been in the practice or study of their profession subsequent to registration for at least two years, and must hold either a surgical degree from a university recognized for that purpose by the College, or a registrable diploma obtained as the result of an examination which includes surgery as well as medicine and midwifery. Candidates are examined in (*a*) the principles and practice of surgery, including surgical anatomy, (*b*) clinical surgery, and (*c*) one optional subject, which they may choose from among the following: surgical pathology and operative surgery, ophthalmology, laryngology, otology and rhinology, gynaecology, obstetric surgery, anatomy, and dental surgery and pathology. The examination is written, oral, and clinical or practical. A candidate who desires to be examined must give one month's notice. After having passed the examination he must lodge with the Clerk to the College a petition asking that his name be placed before the College for election as a Fellow. This petition must be signed by two Fellows, as proposer and seconder, who should be sufficiently acquainted with the candidate to vouch that he is in every way a suitable candidate for the Fellowship. Examinations are held four times a year—January, March, July, and September. It is desirable that either the proposer or the seconder should be resident in Edinburgh. *Candidates are not allowed to appear more than three times at the examinations.*

Licentiates of the College pay £40, and others £50. For further information application should be made to the Clerk of the College, Mr. David Thomson, 49, George Square, Edinburgh, from whom a copy of the *Laws Relating to the Fellowship by Examination* may be obtained.

QUEEN'S UNIVERSITY, BELFAST.

THE degrees granted by the Medical Faculty of this university are as follows: Bachelor of Medicine (M.B.), Bachelor of Surgery (B.Ch.), Bachelor of Obstetrics (B.A.O.), Doctor of Medicine (M.D.), Master of Surgery (M.Ch.), Master of Obstetrics (M.A.O.). The university also confers a diploma in public health. The first three degrees mentioned serve as a qualification for admission to the *Medical Register*, and are not granted separately. In addition to matriculating and passing his professional examinations, a candidate for these degrees must have passed three of the regulation five years as a student at the Belfast School of Medicine. Degrees in dental surgery (B.D.S. and M.D.S.) are conferred by the university, and also a diploma in dental surgery (L.D.S.) and a diploma in psychological medicine.

PROFESSIONAL EXAMINATIONS.

The examinations for the M.B., B.Ch., B.A.O. are four in number. The first deals with: (1) inorganic, organic, and practical chemistry, (2) experimental and practical physics, (3) botany and practical botany, (4) zoology and practical zoology. It is divided into two parts, of which botany and zoology form one. The Second Examination covers anatomy and physiology (both theoretical and practical), and may be taken at the end of the second year of the student's career. The Third Examination includes: (1) pathology and practical pathology, (2) materia medica, pharmacology, and therapeutics, (3) medical jurisprudence, and (4) hygiene. To be valid a certificate in regard to the study of the subjects of this examination must show that the work has been done after the Second Examination has been passed.

The Final Examination includes: (1) medicine, (2) surgery, (3) midwifery, (4) ophthalmology and otology. The student must pass in all subjects at once at the end of his fifth year, or he may divide the examination into two parts—namely, (1) systematic, (2) clinical, practical, and oral. The first part may be taken at the end of the fourth year, but for the second part the candidate may not present himself until the end of his fifth year, but students invariably take both parts at the end of their course. No certificate in regard to the study of the subjects of this examination will be valid unless the work was done subsequent to passing in all the subjects of the Second Examination.

THE HIGHER DEGREES.

Candidates for the degree of Doctor of Medicine must be graduates in medicine of at least three years' standing, unless they hold also a degree of the university in arts or science, in which case a standing of two academic years will suffice. Moreover, candidates must be able to show that the interval has been passed in the pursuit of such courses of study or practical work as may be prescribed. The degree may be conferred either (*a*) after a formal examination, or (*b*) in recognition of the merits of a thesis or of some piece of original study or research carried out by the candidate, followed by an oral or other examination in its subject. When an ordinary examination is imposed it will include (1) a written paper on the principles and practice of medicine, (2) a commentary on a selected clinical case, (3) a clinical and viva voce examination, and (4) a written paper and clinical or practical and viva voce examination on a subject chosen from the following list: (*a*) human anatomy, including embryology; (*b*) physiology, (*c*) pathology, (*d*) pharmacology and therapeutics, (*e*) sanitary science and public health, (*f*) forensic medicine and toxicology, (*g*) mental diseases. The regulations for the degrees of M.Ch. and M.A.O. are of the same general nature.

NATIONAL UNIVERSITY OF IRELAND.

THE National University of Ireland carries on most of its educational work through three constituent colleges—one in Dublin, one in Cork, and one in Galway. Each of these provides a full medical curriculum, and all candidates for the medical degrees of the university must pass three of their five years of study at one or other of them. These years do not count except after matriculation or recognition as a student of the Medical Faculty obtained in some other fashion. The candidates at each constituent college are examined by the university, and a common standard of education is secured by all courses of instruction and the regulations concerning them having to be approved by the Senate, after considering report thereon from the Board of Studies of the university. In addition to the ordinary degrees in medicine and surgery, the university grants those of Bachelor and Master of Obstetrics, Bachelor and Doctor of Science in Public Health, and Bachelor and Master in Dental Surgery, as well as Diplomas in Public Health, in Mental Diseases, and in Tropical Medicine.

Application for other information may be made to the Registrar, National University of Ireland, 49, Merrion Square, Dublin, C.17.

THE IRISH CORPORATIONS.

THERE are, in the Irish Free State, three licensing bodies other than the Medical Faculties of the universities; and in Dublin, just as in London, there is a Royal College of Physicians of Ireland, a Royal College of Surgeons in Ireland, and an Apothecaries' Hall. In Dublin, as in London and in Edinburgh, the two Colleges have formed an examining Conjoint Board, which is responsible for the recommendation of candidates to the two bodies for their respective licences. The Apothecaries' Hall of Ireland, like the Apothecaries' Society of London, gives its licence separately.

THE CONJOINT BOARD IN IRELAND.

THIS body requires of candidates either the passage of its own preliminary examination in the subjects of general education or proof that the candidate has passed one of the tests accepted by the General Medical Council as well as passing in the pre-registration examinations in chemistry and physics and biology.

PROFESSIONAL EXAMINATIONS.

There are three professional examinations, the first of which cannot be passed earlier than the end of the second winter session, nor the final before the conclusion of full five years of medical study. Before being admitted to any of them the candidate must show that he has studied the different subjects in practice and theory for the requisite periods, certificates to this effect being accepted from the authorities of most of the recognized medical schools at home and abroad. The first examination deals with (*a*) anatomy, and (*b*) physiology and histology. The second examination deals with (*a*) pathology, including morbid anatomy, clinical pathology, and bacteriology; (*b*) materia medica, pharmacy, and therapeutics; (*c*) forensic medicine, hygiene, and public health; (*d*) ophthalmology and aural surgery; and may be taken separately.

Final Examination.—This is divided into three divisions, which cannot be completed until at least five years have passed in medical studies other than those for the pre-registration examinations, and five years at least since the beginning of the curriculum. The divisions are: (*a*) medicine, including fevers, mental diseases, and diseases of children; (*b*) surgery, including operative surgery; (*c*) midwifery, including diseases of women and newborn children, and the theory and practice of vaccination.

Fees.—Preliminary Examination, £2 2s. Re-examination, £2 2s. Pre-Registration Examination, £3 3s. Re-examination in Chemistry, £2 2s.; in Physics, £1 1s. First Professional Examination, £26 5s.; Second, £9 9s.; Final, £6 6s. Re-examination fee is £2 2s. for each division.

Diploma in Psychological Medicine.

There are two examinations in connexion with this diploma: Part I consists of (*a*) anatomy and physiology of the nervous system, (*b*) psychology. Part II—(*a*) neurology, including clinical and pathological neurology; (*b*) psychiatry, or psychological medicine, including its legal relationships.

Fees.—£6 6s. for each part.

Further information can be obtained from Mr. Alfred Miller, Secretary of the Committee of Management, Royal College of Surgeons, St. Stephen's Green, Dublin.

CHARING CROSS HOSPITAL.

THIS school, with its hospital, is situated in the centre of London, and is easily accessible. Primary and intermediate students attend lectures and practical work at King's College. The final studies are taken in the school and hospital, where systematic lectures, demonstrations, and tutorial classes are arranged to cover all the subjects necessary for the qualifying examinations. Departments are also available for the other final subjects of bacteriology, clinical pathology, biochemistry, materia medica, public health, operative surgery, and for research work. An Institute of Pathology, with a whole-time staff of scientific workers and fully equipped laboratories, has been established in the school. Students receive their training in preventive medicine, pathology, and bacteriology here, and are encouraged to undertake research.

A number of scholarships and exhibitions are awarded to university and other students, particulars of which can be obtained from the Dean.

Fees.—The fees are as follows: Entrance, Primary and Intermediate, 10 guineas; Final, 8 guineas. Annual, 38 guineas.

Further information may be obtained on application to the Dean of the Medical School, Charing Cross Hospital, London, W.C.2.

GUY'S HOSPITAL.

THE hospital contains 646 beds in constant occupation. Twenty-five beds are set apart for diseases of the eye, and 42 for the most urgent and interesting medical cases, which form the subjects of the weekly clinical lectures. There are special wards of 49 beds for the reception of cases of diseases of women and for cases of difficult labour. Beds are also allotted to the throat and ear departments, the departments of orthopaedics, neurology, and dermatology, the department for the treatment of diseases of the genito-urinary system, and the children's department; there are also some special beds for the treatment of syphilis.

The residential college fronts the east gate of the hospital, providing accommodation for resident students. This contains a dining hall, reading rooms, a library of general literature, and a gymnasium for the use of the residents and of the members of the Clubs Union. The athletic ground at Honor Oak Park is reached from the hospital in fifteen minutes. The Gordon Museum of Pathology, the Wills Library, the departments of chemistry, physics, pathology, and pharmacology, and the school buildings in general, afford opportunities for a liberal education and for research, and provide the full curriculum for all medical degrees and diplomas. New departments of anatomy, physics, and biology have recently been completed. They are equipped on the most modern lines, and provide ample accommodation for teaching and research. Special classes are held for the First and Second Examinations for medical degrees of the University of London, for the pre-medical examination, and for the First and Final F.R.C.S.Eng Examinations. Special teaching is provided to meet the requirements of the Universities of London, Oxford, and Cambridge in general pathology and pharmacology.

Appointments.—All appointments are made according to the merits of the candidates, as determined by a committee of the medical staff. Sixteen out-patient officers, eight house-physicians, twenty assistant house-surgeons, eight house-surgeons, two ophthalmic house-surgeons, two genito-urinary house-surgeons, two house-physicians (children's department), two house-physicians (dermatological and neurological), and nine resident obstetric assistants are appointed annually. The house-physicians and house-surgeons, obstetric residents, ophthalmic house-surgeons, and genito-urinary house-surgeons hold office for six months each, and receive free board and lodging in the college. Every student is provided with rooms and commons in the hospital during the period of his "take in" as senior dresser. In addition to the clerkships and dresserships in the medical and surgical wards, students are appointed to the posts of clinical assistant dresser, or clerk in the special departments of ophthalmology, laryngology, gynaecology, diseases of children, diseases of the nervous system, dermatology, otology, actinotherapeutics, anaesthetics, dentistry, orthopaedics, vaccine, tuberculosis, fractures, and genito-urinary and venereal disease; clinical assistantships in the various special departments are open to post-graduates.

Scholarships, Prizes, etc.—The following scholarships in Arts and Science are awarded. A. Open Junior Scholarships: (1) An Arts Scholarship of the value of £100, (2) a Science Scholarship of the value of £100; these are awarded annually in June or July. (3) A War Memorial Scholarship of the value of £200, awarded alternately in Arts and Science. This scholarship is open every other year; the next award will be made in June or July, 1932 (in Arts). B. Confined Scholarship in Science. A Junior Science Scholarship of the value of £100 is offered for competition annually in June or July to candidates who have attended the preliminary science classes at this school. Candidates for these scholarships (male students only) must be under 20 years of age on August 1st of the year of the competition. C. Open Senior Science Scholarships: (1) A War Memorial Scholarship of the value of £100, (2) an Open Scholarship of the value of £80; both of these are awarded annually in September. Full particulars as to the scholarships may be obtained from the Dean of the Medical School. Junior prizes for general proficiency, £20, £15, £10; Hilton Prize for dissection, £5; Michael Harris Prize for anatomy, £10; Sands-Cox Scholarship for physiology, £15 for three years; Wooldridge Memorial Prize for physiology, £10; Beaney Prize for pathology, £34; Treasurer's Gold Medal in medicine, Treasurer's Gold Medal in surgery, and the Golding-Bird Gold Medal and Scholarship for bacteriology (£20), are awarded annually after competitive examination. The Gull Studentship in pathology, of the value of £250 per annum, the Beaney Scholarship in materia medica, of the value of about £50, and the Anderson Demonstratorship in clinical chemistry, value £175 per annum, are awarded without examination to enable research to be carried on in these subjects. An Arthur Durham Travelling Scholarship of £100 is awarded triennially. The Griffiths Demonstratorship in Pathology, of the value of £320 per annum, and the Hilda and Ronald Poulton Fellowship, value £150 per annum, are awarded without examination.

An annual composition fee is paid by all students until a registrable qualification is obtained. Further information may be obtained from the Dean of the Medical School, Guy's Hospital, London Bridge, S.E.1.

KING'S COLLEGE HOSPITAL.

THE medical school of this hospital, which is situated at Denmark Hill, deals with the Final Examination subjects of the medical curriculum. The hospital was opened in 1913, and is one of the most modern and best equipped in England. The number of attendances in the casualty and out-patient departments during the year 1929 amounted to 283,136. In the education at the hospital a special feature has always been the individual attention given to each student. The studies are co-ordinated under the direction of senior members of the honorary staff, assisted by medical, surgical, obstetric, and pathological tutors.

The Hall of Residence for members of the medical school is situated on Champion Hill. Both the Hall and the athletic ground are within ten minutes' walk of the school.

Appointments.—Sixteen resident medical and surgical officers are appointed half-yearly, as well as dressers and clerks in the wards, out-patient departments, post-mortem rooms, and special departments. Each of the special departments has several clinical assistants. There are five registrars and four tutors, all of whom receive salaries. The Clubs and Societies Union combines athletics, music, and other societies connected with the school, and provides also a common room.

Scholarships, etc.—At entrance: Science Scholarship, £75. At commencement of Final Studies: Anatomy and Physiology Scholarship, £75; Pathology Scholarship, £75; two Raymond Gooch Scholarships, each £60 a year for two years; two Burney Yeo Scholarships, each £80 (for Oxford and Cambridge students); Seaman Scholarships, £50 a year up to five years; Epsom College Scholarship, £100; Senior Scholarship, £40; Todd Prize, Tanner Prize, Ferrier Prize in Neurology, Class Prizes and Medals.

Fees.—The composition fee is 93 guineas if paid in one sum. Entrance fee of 10 guineas includes membership of the Clubs and Societies Union.

Dental School.—This school was opened in October, 1923, and provides complete courses for dental degrees and diplomas. The director of dental studies is Dr. A. Livingston, M.B., Ch.B., M.D.S., L.D.S.

The calendar of the school can be obtained on application to the Dean, H. Willoughby Lyle, M.D., F.R.C.S., or to the Secretary of the Medical School, S. C. Ranner, M.A., King's College Hospital, Denmark Hill, S.E.5.

THE LONDON HOSPITAL.

THIS hospital, with its medical college and dental school, is situated in the Mile End Road, E.1. The hospital contains 839 beds, which are in constant use. During 1929, 13,992 patients passed through the wards and 89,972 out-patients

value £25; Leopold Hudson Prize, value 11 guineas; and the Second Year's Exhibition, value 10 guineas.

The rebuilding of the hospital is being carried out without the loss of a single bed, or any disorganization of its clinics.

Fees.—(*a*) Pre-medical students: For one year or less, £21. (*b*) Students who have completed the Preliminary Science course: Entrance fee, 25 guineas, payable on joining the medical school; five annual fees of £45. The annual fee for further attendance at the medical school, if a registrable qualification has not been obtained, is £23. (*c*) Oxford and Cambridge and other students who have completed the Intermediate course: entrance fee, 15 guineas; three annual fees of £45; further annual fees as above. These fees are inclusive and cover the cost of instruction in vaccination, fevers, etc., and also the subscription to the amalgamated clubs and hospital journal.

Further information may be obtained from the Dean or the School Secretary.

ST. BARTHOLOMEW'S HOSPITAL.

THIS institution fills one side of Smithfield and Giltspur Street, covering the greater part of a large island of ground separated practically from all other buildings; it is on the edge of the City, and easily reached from all parts of London. The hospital contains 757 beds. Extensive buildings, opened in July, 1907, occupy part of the ground acquired from the old Bluecoat School, and these materially enhance the attractions of the hospital as a place of medical study. The medical school buildings, including the library, the museum, and the chemical, biological, and anatomical departments, have now at their side a very large building, which includes club rooms for the Students' Union, a writing room, luncheon and dining halls, new quarters for the resident staff, and an out-patient department and accommodation for special departments of such large size as to be unsurpassed by any hospital in the kingdom. During the year 1909 a second block of new buildings was completed. These form the pathological department, and include, in addition to an extensive post-mortem room, large and well-equipped laboratories for clinical pathology, pathological histology, bacteriology, and chemical pathology, altogether forming the most complete pathological department in the country. A further large block in Giltspur Street was acquired in 1923, and has been equipped by the construction of new lecture theatres and extensive laboratories for physics, chemical physiology, experimental physiology, histology, and pharmacology. The new block of surgical wards and five operation theatres (one attached to each surgical unit), with accommodation for 250 patients, was opened in June, 1930. One of the old blocks previously used for surgical cases has been reconverted for the housing of an enlarged gynaecological and obstetrical unit, with separate operation theatres attached. The Students' Union owns grounds of some ten acres in extent for recreative purposes at Winchmore Hill, which is easily accessible from the hospital.

Special classes are held for students preparing for the Preliminary Scientific and other examinations, for the M.B., M.D. of the Universities of Oxford, Cambridge, and London, and for the higher surgical degrees at the same universities, including the M.Ch.Oxon., M.Chir.Cantab., M.S.Lond., and F.R.C.S.Eng.

Clinical Units.—Special clinical units have been established in medicine and surgery, each under the charge of a professor and director, who devotes the whole of his time to the purpose of hospital practice, teaching, and research. In each unit there are an assistant director and four assistants, for whom special laboratory accommodation has been provided by a gift from the Sir William Dunn Trustees. The appointments of clerks and dressers are open to all students in these departments, and arrangements are made for all students to study in these units during a part of their clinical course.

Appointments.—Clinical clerks to the physicians and to the physician-accoucheur, and dressers to the surgeons and in the casualty department, are chosen from the students; clerks and dressers are also selected from the students to attend in the out-patient rooms, in the special departments (ophthalmic, orthopaedic, gynaecological, children's, laryngological, aural, dermatological, venereal, electrical, and dental), and in the post-mortem room. Chief assistants and clinical assistants are selected from qualified men appointed yearly to help in the general medical, surgical, and in special departments. Ten house-physicians and ten house-surgeons are appointed annually. During their first six months of office they act as "junior" house-physicians and house-surgeons, and receive a salary of £80 a year. During their second six months they become "senior" house-physicians and house-surgeons, and are provided with rooms by the hospital authorities, and receive a salary of £80 a year. A resident midwifery assistant, an ophthalmic house-surgeon, a house-surgeon to the skin and venereal department, and a house-surgeon for diseases of the throat, nose, and ear are appointed every six months, and are provided with rooms and receive a salary of £80 a year. Three resident administrators of anaesthetics are appointed—the senior for one year at a salary of £150, and two juniors for six months with a salary at the rate of £80 per annum—and all are provided with board and rooms. An extern midwifery assistant is appointed every three months, and receives a salary of £80 a year.

Scholarships.—Four Entrance Scholarships are annually awarded after examinations held in September. The subjects of examination and conditions of eligibility for these scholarships are: (1) One scholarship, value £75, in not fewer than two and not more than three of the following subjects: chemistry, physics, botany, zoology, physiology, pathology, and anatomy, limited to students under 25 years of age who have not entered on the medical or surgical practice of any London medical school. (2) One scholarship, value £100, in not fewer than three of the following subjects: chemistry, physics, botany, zoology, and physiology, limited to students under 21 years of age who have not entered on the medical or surgical practice of any London medical school. (3) An entrance scholarship in arts, of the value of £100, in mathematics; Latin or Greek, or French or German; a second language or chemistry or physics. (4) The Jeffreson Exhibition in the same subjects as No. 3—of the value of £50. Candidates for Nos. 3 and 4 must be under 19 years of age. The total value of the scholarships and prizes is over £1,200 annually.

Further information and a handbook can be obtained on application to the Dean of the Medical College, St. Bartholomew's Hospital, E.C.1.

ST. GEORGE'S HOSPITAL.

THIS school is at Hyde Park Corner, and is carried on in connexion with St. George's Hospital, an institution having a service of 436 beds, of which 100 are at the convalescent hospital at Wimbledon. It provides for the instruction of its students in the preliminary and intermediate subjects of the curriculum at the teaching centre of London University established at King's College. The school at Hyde Park Corner is devoted entirely to the teaching of clinical subjects, great attention being paid by the members of the staff to individual teaching. A number of special courses are given, in which the requirements of university and all other examinations receive careful attention.

The St. George's Hospital Club consists of an amalgamation club, with smoking and luncheon rooms on the hospital premises, and other students' clubs, with an athletic ground at Wimbledon. Students have the advantage of a well-filled library of medical and scientific books. A register of accredited apartments and a list of medical men and others willing to receive St. George's men as boarders may be seen on application to the Dean.

Appointments.—Two house-physicians, two house-surgeons, and two casualty officers are appointed every two months. The house officers reside and board in the hospital free of expense. The casualty officers are non-resident, and receive salaries at the rate of £100 per annum. After the student has held a house appointment, the following are, among others, open to him: assistant resident physician at £250 per annum; assistant resident surgeon at £250 per annum; medical officer to the Atkinson Morley Convalescent Hospital at £300 per annum; medical registrarship at £200 per annum; surgical registrarship at £200 per annum; medical officer to the biochemical department at £100 per annum; assistant curatorship of the museum, £100 per annum; obstetric assistantship, resident, at £100 per annum; the post of resident anaesthetist at £100 per annum; the posts (three) of junior anaesthetist, each at £30 per annum.

Scholarships.—The following Entrance Scholarships and Exhibitions in anatomy and physiology and in general pathology are awarded in July to candidates who have passed the second M.B. London or corresponding examination: Senior William Brown Exhibition of the value of £120; Junior William Brown Exhibition of the value of £80; Anne Selina Fernee Scholarships (two) of the value of £80 each; Devitt-Pendlebury Scholarship of the value of £50; and Exhibitions, each of the value of £40 and up to six in number. Other prizes to the value of £200 are awarded annually to the students of the hospital.

Scholarship, tenable for two years, £60 annually, pathology; (*p*) School Council Research Scholarship, £250 per annum; (*q*) John and Temple Research Scholarship, value £450 per annum (children).

Fees.—The annual fees are: For each year of study, £50. These fees cover all tutorial classes, but do not include instruction in infectious fevers.

Special courses of instruction are given for various examinations. Further information may be obtained from the Medical Secretary of the School, St. Thomas's Hospital, Albert Embankment, S.E.1.

UNIVERSITY COLLEGE HOSPITAL.

THE school, which forms part of the corporation of University College Hospital, is in immediate proximity to the hospital in University Street, and opposite University College. It comprises departments of medicine, surgery, midwifery and gynaecology, pathology including morbid anatomy, chemical pathology, biochemistry and bacteriology, cardiography, forensic medicine, mental physiology and mental diseases, dental surgery, practical pharmacy, and other departments for the study of special diseases, such as those of the eye, skin, ear and throat, venereal diseases, and for instruction in anaesthetics, electro-therapeutics, and skiagraphy. The hospital and school have acquired the National Dental Hospital and College as their dental departments, thus providing every facility for the study of dental subjects. The Royal Ear Hospital has also been amalgamated as the Ear, Nose, and Throat Department, and a new hospital for in- and out-patients, close to University College Hospital, is completed.

The school thus provides the final course of study for the degrees of the Universities of Oxford, Cambridge, London, Durham, and other British universities, and for the diplomas of the Royal Colleges of Physicians and Surgeons in medicine and in dental surgery, and the Licence of the Society of Apothecaries. Each department is also equipped for more advanced work, and provides facilities for research.

Clinical units in medicine, surgery, and obstetric medicine are now in operation. The whole-time directors of the units are concerned with the organization of the teaching generally, but the honorary staff is responsible for the largest share of the teaching in the wards and out-patient department of the hospital.

The new buildings of the obstetric hospital of 74 beds (rendered possible by the Rockefeller benefaction), the new Residents' House (with accommodation for 33 residents and students), the extension of the Nurses' Home, and the new research laboratories for the Medical School, are now finished and in full occupation.

Appointments.—The qualified appointments, in addition to a number of posts as house-physicians and house-surgeons and obstetric assistants, include the appointments of resident medical officer, medical registrars, surgical registrar, obstetric officer, Harker Smith radium registrar, ophthalmic registrar, casualty medical officers, casualty surgical officers, assistants in ear, nose and throat, skin and venereal diseases departments, and house anaesthetists.

Scholarships.—The following scholarships and prizes are open to competition: Two Entrance Exhibitions of 112 guineas each, awarded after a competitive examination in any two of the following subjects: anatomy, physiology, or general pathology: Radcliffe Crocker Travelling Scholarship in dermatology for one year, value about £280; the Graham Scholarship in pathology of a sum not exceeding £400 per annum; Leslie Pearce Gould Research Scholarship in surgery for one year, value about £200; the Atkinson Morley Scholarship of £45 a year for three years, awarded after examination in the theory and practice of surgery; the Atchison Scholarship of £55 a year for two years for general proficiency in medical studies; the Magrath Clinical Scholarship, value about £150; the Filliter Exhibition in pathology of £30; the Percival Alleyn Prize for the advancement of surgery by research, value about £75; the Graham Gold Medal for research work; four Fellows Medals in clinical medicine; Liston Medals in clinical surgery; the Bruce Medal in pathology and surgery; two Luke Medals in pathology; and the Erichsen Prize for practical surgery.

Fees.—The fee for the full course of final studies at the school is 112 guineas if paid in one sum, or 115 guineas if paid in two instalments. Fees for vaccination, fevers, and pharmacy not included.

Particulars of general and special courses can be obtained on application to the Dean of the Medical School, University College Hospital, University Street, W.C.1.

WESTMINSTER HOSPITAL.

THE school, with its hospital situate in Broad Sanctuary, opposite Westminster Abbey, provides for the education of its students in the preliminary and intermediate subjects of the University of London at King's College. The rest of the work is done in the school buildings near the hospital. The number of in-patients averages 4,000 and out-patients upwards of 30,000 annually, and the hospital and school afford ample facilities for instruction in all branches of medicine and surgery.

Appointments.—A medical and surgical registrar are appointed annually, each with a salary of £150, and an obstetric registrar with a salary of £150. An assistant medical registrar and an assistant surgical registrar, salary £100 per annum each, are appointed for six months. A senior resident and casualty officer, salary £104 per annum and board, appointed for six months, may be extended for a further period of six months. A medical registrar to the children (Wander scholar), salary £225, is appointed for one year. Three house-physicians, three house-surgeons, three assistant house-physicians, three assistant house-surgeons, and a resident obstetric assistant are appointed after examination, and are provided with rooms, commons, and salary of £52 per annum, except the assistant house-physicians and the assistant house-surgeons, who are provided with commons only. The assistant house-physicians, after three months' service, become house-physicians for a further period of six months, and the assistant house-surgeons, after three months' service, become house-surgeons for a further period of six months. Two house-anaesthetists are appointed for three months, non-resident, salary £50 per annum. Clinical assistants to the assistant physicians and assistant surgeons, and to the officers in charge of special departments, are appointed from among the qualified students. Every student must perform the duties of out-patient dresser for three months, and afterwards hold the office of in-patient dresser for three months. He is also required to serve two terms of three months each as medical clinical clerk to the in-patient physician and one term as gynaecological clinical clerk. Two pathological clerks are appointed every three months to assist in the post-mortem room. No student is eligible as an in-patient dresser or clinical clerk until he has passed the Second Examination of the Conjoint Board, or an equivalent examination. Clerks and dressers in the special departments of hospital practice are periodically appointed. So far as vacancies permit, students of other hospitals are admitted to in-patients' dresserships or clerkships.

The governors of the hospital have now completed the extensive improvements and alterations to the hospital, which render it a still more efficient teaching institution, with an increased number of beds. An annexe devoted to radium therapy and research, containing twenty-two beds, has recently been opened.

The athletic ground is situated at Tooting, and can be reached in twenty minutes from the hospital.

Scholarships.—The following open scholarships are offered for competition during the year 1930-31: In the winter session two scholarships in anatomy and physiology, £75 each. In the spring two scholarships in anatomy and physiology, £75 each. A certain number of scholarships have been allotted to universities of England, Wales, and the Colonies, and to public schools. These scholarships are awarded entirely on the nomination of the Principal of the university or school.

Fees.—The annual composition fee is £40. An entrance fee of 10 guineas is payable by all students—namely, primary and intermediate students, £10 10s.; students entering for the final subjects, £8 8s. These fees include subscriptions for membership of the Clubs Union.

Further information and a prospectus can be obtained on application to the Dean at the Westminster Hospital, Westminster, S.W.1

LONDON (ROYAL FREE HOSPITAL) SCHOOL OF MEDICINE FOR WOMEN.

THE school is situated at 8, Hunter Street, Brunswick Square, W.C.1, close to the Royal Free Hospital. It is, like all the other London schools which have so far been mentioned, one of the constituent schools of the University of London. The laboratories are extensive and well lighted,

OXFORD AND CAMBRIDGE.

AT both Oxford and Cambridge there are medical schools which furnish unsurpassed opportunities for obtaining a good knowledge of the preliminary sciences and of anatomy, physiology, and pathology. The laboratories are excellently furnished, and the teaching staffs most distinguished. Both schools provide a full medical curriculum, and there is no essential reason why the student should not complete his career at either of them; but this is not commonly done, and is never, in the ordinary way, advised by the university medical authorities. The local hospitals—the Radcliffe Infirmary at Oxford and Addenbrooke's Hospital at Cambridge—though well equipped, are comparatively small. Students are therefore encouraged, as soon as they have completed the earlier examinations and taken a degree in arts, to join one of the London medical schools, and thus spend the time of their preparation for the final examinations in a city where the opportunities for gaining clinical knowledge are greater and more varied. A considerable proportion of Oxford and Cambridge medical students take the London Conjoint diplomas before graduating in medicine and surgery at their own university. The experience gained by holding resident hospital appointments is naturally of much advantage when sitting for the Final M.B. examination and when engaged in composing a thesis.

BIRMINGHAM.

THE school in this city is carried on by the Medical Faculty of the University of Birmingham, its students having an adequate number of good laboratories, classrooms, and other necessaries devoted to their use by the university. The clinical work is done at the General and Queen's Hospitals, which are amalgamated for the purpose. Together they have upwards of 700 beds for medical, surgical, and special cases, with an array of special departments of all kinds, including one for lying-in women. Clinical instruction is given in the wards and out-patient and special departments daily, and formal clinical lectures are delivered weekly throughout the session. Special tutorial classes are also held alike for the degrees of Birmingham and some other universities and for the diplomas of corporations.

Appointments.—The large number of appointments open to past or other students includes the following:—At the General Hospital: two surgical registrars, £100 (commencing) a year; one resident medical officer, salary £155 a year; one resident surgical officer, salary £180 a year; one assistant resident surgical officer, salary £100 a year; one resident pathologist, salary £70 a year; two visiting anaesthetists, salary £50 a year; two resident anaesthetists, salary £120 a year; four house-surgeons, office tenable for nine months, £70 a year; one house-surgeon to the gynaecological and one to the special departments, each tenable for six months, £70 a year; four house-physicians, post tenable for six months, £70 a year. At the Queen's Hospital: one resident medical registrar, salary £200 a year; two resident surgical officers, £100 a year, tenable for three years; three house-physicians, three house-surgeons, one obstetric and one ophthalmic house-surgeon, one ear, nose, and throat house-surgeon, and one house-physician for duty at the Nerve Hospital (associated with Queen's Hospital), tenable for six months, salary £70 a year, with board, lodging, and washing; one casualty house-surgeon, tenable for three months, salary £70 a year, with board, lodging, and washing. At the City Public Assistance Institutions: five resident medical officers. At the Birmingham General and Branch Dispensaries: twelve resident surgeons. At the Birmingham Mental Hospitals: five assistant medical officers. At the City Fever Hospitals: three assistant medical officers. At the Children's Hospital: one resident surgical officer, one resident medical officer. At the Birmingham and Midland Eye Hospital: four resident surgeons. At the Orthopaedic and Spinal Hospital: two clinical assistants (non-resident). At the Ear and Throat Hospital: one house-surgeon, £70 a year; four clinical assistants (non-residents). Four non-resident appointments are in the gift of the Public Assistance Committee.

Scholarships.—There are numerous money and other awards for students of sufficient merit, among them being the following: The Walter Myers Travelling Studentship of £300, offered each alternate year for research work and tenable abroad; the Sands-Cox Scholarship of £42 (an entrance scholarship in the Faculty of Medicine, awarded on higher school certificate examination of the Joint Matriculation Board (July)); four Queen's Scholarships of £10 10s. each, awarded annually at the second (Part II), third, fourth, and final university examinations respectively; one or more Sydenham Scholarships, allotted on entrance to students who are the sons of deceased medical men; the Ingleby Scholarships (two) of £10 for proficiency in midwifery and diseases of women; the Arthur Foxwell Memorial Gold Medal (clinical medicine); the Sampson Gamgee Memorial Medal for surgery (Final M.B.); the Russell Memorial Prize (for examination in nervous diseases, final year); the Priestley Smith Prize in ophthalmology (awarded in the final examination); and the Peter Thompson Prize in anatomy (value about £6) for students in their third university year. There is also a scholarship of £46 17s. 6d. for students proceeding to a degree in dental surgery. University Clinical Board Prizes are awarded annually as follows: Senior Medical Prize, gold medal; Senior Surgical Prize, gold medal; Midwifery Prize, gold medal; Junior Medical Prize, silver medal; Junior Surgical Prize, silver medal.

Fees.—The composition fee for university classes is £106 5s. This covers all the work required for the degrees of Birmingham and some other universities, and for the ordinary qualifications of licensing corporations, but not the additional courses required for the Fellowship of the Royal College of Surgeons of England, the diploma and degrees of the university in State medicine, and some other special work. The total cost for the six years' curriculum, including hospital and examination fees, is estimated at £242 17s. 6d.

Other information should be sought from the Dean of the Medical Faculty, University, Edmund Street, Birmingham.

BRISTOL.

THE school is carried on by the Faculty of Medicine of the university, and provides full instruction for all its degrees and for the diploma in dental surgery.

Clinical Instruction.—The allied hospitals (Bristol Royal Infirmary and Bristol General Hospital) have between them 663 beds and extensive out-patient departments, special clinics for diseases of women and children, and those of the eye, throat, and ear, in addition to large and well-equipped departments for dental work and large out-door maternity departments. At each of these institutions there are well-arranged pathological museums, post-mortem rooms, and laboratories for morbid anatomy. There are also laboratories for work in clinical pathology, bacteriology, and cytology, in which special instruction is given in these subjects. Departments are provided and well equipped for *x*-ray work, both for diagnosis and treatment, for electrocardiography, and for the various forms of electrical treatment, including high-frequency currents, electric baths, Finsen light treatment, and massage. The students of the school also attend the City and County Mental Hospital, the Ham Green Fever Hospital, the practice of the Royal Hospital for Sick Children and Women, containing 100 beds, and that of the Bristol Eye Hospital, with 40 beds. In addition, by the kind permission of the Health Committee of the Bristol City Council, students may attend the clinical practice at Southmead Hospital, which has 556 beds. The new Orthopaedic Hospital at Winford is also available.

Appointments.—(1) Undergraduate: Medical clerkships, surgical dresserships, also ophthalmic, obstetric, pathological, dermatological, ear, nose, and throat clerkships, are tenable at the Bristol Royal Infirmary and the Bristol General Hospital. In these institutions the dressers reside in rotation free of charge. (2) Post-graduate: At the Bristol Royal Infirmary: four house-surgeons, one casualty house-surgeon, two house-physicians, one house-physician for cancer research wards, one resident obstetric officer, one ophthalmic and gynaecological house-surgeon, one ear, nose, and throat house-surgeon, one assistant to the senior resident medical officer, who also acts as house-surgeon and house-surgeon to the skin department, and one dental house-surgeon. All these appointments are for six months. Salary in each case at the rate of £60 per annum, with board, apartments, and laundry, except the casualty house-surgeon and the dental house-surgeon, who receive £80 per annum. From the resident medical officers a senior resident medical officer is appointed at a salary of £200 per annum. At the Bristol General Hospital: senior resident medical officer, £250 per annum; casualty house-surgeon, £60 per annum; two house-physicians, £60 per annum; two house-surgeons, £60 per annum; resident obstetric officer, £60 per annum; house-surgeon to special depart-

Appointments.—The nature of the appointments open to past and other students at this school will be gathered from the account which follows of the hospitals forming its clinical department.

Scholarships.—The awards made each year to successful students total over £1,500. They include the following: Two Holt Fellowships, one in pathology, the other in physiology; a Robert Gee Fellowship in anatomy; two John Rankin Fellowships in anatomy; a John W. Garrett International Fellowship in bacteriology; a Johnston Colonial Fellowship in biochemistry; an Ethel Boyce Fellowship in gynaecology; and a Thelwall Thomas Fellowship in surgical pathology; one Lady Jones Fellowship in orthopaedic surgery (value of Fellowships: two at £200, two at £150, two at £120, four at £100); a University Scholarship of £50, awarded on the results of the Final M.B. (Part A) Examinations; a Ridgway Research Scholarship (£100); a Scholarship in mechanical dentistry of £20; two Lyon Jones Scholarships, of the annual value of £21 each for two years, one for the junior and the other for the senior students; the Derby Exhibition of £15; the Clinical School Exhibition of £15; the Owen T. Williams Prize; the Torr Gold Medal in anatomy; John Rankin Exhibition in practical anatomy, £25; the George Holt Medal in physiology; the Kanthack Medal in pathology; Mitchell Banks Medal in anatomy; the Robert Gee Prize of £5 5s. in children's diseases; Mary Birrell Davies Memorial Scholarship (women), £60 per annum for four years; Robert Gee Entrance Scholarship (men), value of £42 10s. per annum for four years; Dental Operating Prizes (four); Orthodontia Prizes (two); Samuels Memorial Scholarships, three at £20 each; one Thomas H. Bickerton Prize in anatomy; Dr. N. E. Robert Prize in zymotic diseases; Ash's Prize in dental surgery, value £2 2s.; Gilmour Medal; and other entrance scholarships. In addition, a number of gold and silver medals have recently been instituted in the following subjects: pharmacology, surgery, forensic medicine and toxicology, public health, medicine, obstetrics and gynaecology, orthopaedic surgery, and laryngology and otology.

Fees.—Information as to the fees for the courses of instruction provided by the schools should be sought from the Dean of the Medical Faculty.

The Clinical School.

As many as nine hospitals have combined to form the clinical school of the university, these being: The Royal Infirmary, the David Lewis Northern Hospital, the Royal Southern Hospital, the Stanley Hospital, the Royal Liverpool Children's Hospital, the Hospital for Women (with the Samaritan Hospital), the Liverpool Maternity Hospital, the Eye and Ear Infirmary, and St. Paul's Eye Hospital. Between them they provide over 1,500 beds.

MANCHESTER.

THE staff of the Medical School in this city constitutes the Medical Faculty of the Victoria University, all the arrangements for the instruction of students, both in their earlier and their later studies, being of an elaborate nature. The clinical work of the undergraduates is done chiefly in connexion with the Royal Infirmary, an institution which itself contains 614 beds, and has associated with it a large convalescent home (132 beds) and a Central Branch Hospital (54 beds). The courses in mental diseases are partly taken in the County Mental Hospitals at Prestwich and Macclesfield. Instruction in practical gynaecology and midwifery is given at the Royal Infirmary and the St. Mary's Hospitals.

Appointments.—The following are among the appointments open to past and present students of this school in connexion with its arrangements for clinical tuition: Two surgical registrars, at £150 per annum; two pathological registrars, at £100 and £50 per annum; one medical registrar, at £150 per annum; a cardiographic registrar, at £150 per annum; a surgical tutor, at £30 per annum; a director of the clinical laboratory, at £400 per annum, and two assistants, at £350 and £300; three assistant medical officers and three assistant surgical officers, each at £35 per annum; assistant surgical officers, aural department, at £35 per annum; seven anaesthetists, from £75 to £125 per annum each; one resident medical officer, one year, £200 per annum; one resident surgical officer, one year, £200 per annum; three resident medical officers for Central Branch, one at £200 and two at £100 per annum; one assistant resident surgical officer, £150 per annum; one resident medical officer at the Convalescent Hospital at Cheadle, £250 per annum; two assistant medical officers to radiological department, £150 and £105 per annum; medical officer, physio-therapeutic department, £150 per annum; assistant surgical officer, gynaecological department, £35 per annum; assistant to the dermatologist, £20 per annum; and three assistant surgical officers for Central Branch, £75 per annum; ten senior and ten junior house-surgeons and ten house-physicians, appointed during the year for periods of six months, at a salary of £50 for the first six months, and £100 for the second six months. Resident officers are appointed to the gynaecological, the eye, and the ear and throat departments every three months. Clinical clerks and surgical dressers are appointed to the various departments of the hospital every three months. Non-resident clinical assistantships for qualified medical men and women, tenable for six months, at an honorarium of £35.

Entrance and other Scholarships.—The following are among the scholarships obtainable by students of the school: Rogers and Seaton Scholarships in Arts (in alternate years), £40 per annum, tenable for two years. Three Hulme Scholarships, tenable for three years, of £35, one being awarded annually for proficiency in subjects of general education. Two James Gaskill Scholarships of £35, tenable for two years, one being awarded annually for proficiency in the branches of mechanics and chemistry. A Dora Muir Scholarship, £30 per annum, tenable for three years, and open to the competition of women students only. This is awarded triennially. Sir J. P. Kay-Shuttleworth Scholarship, £30 per annum, tenable for three years, awarded triennially, open to the competition of scholars from Sedbergh School, Giggleswick School, and Burnley Grammar School; subjects—mathematics, chemistry, and mechanics. Dreschfeld Memorial Scholarship, value £20, tenable for two years and awarded triennially on the result of the Entrance Examination. John Russell Medical Entrance Scholarship, awarded annually, value £45. Two Dauntesey Junior Medical Scholarships, value £50 each, tenable for one year, for candidates who have not commenced the second year of study leading to a medical qualification; subjects—zoology, botany, and chemistry. One Dauntesey Senior Medical Scholarship, £50 for one year, awarded on results of Second M.B. Examination. Two Entrance Scholarships in medicine, value 160 guineas, awarded annually for proficiency in arts or science respectively. Tom Jones Exhibition in anatomy, £25, offered annually. A Robert Platt Physiological Scholarship of £90, tenable for one year. A Leech Fellowship of £100 for original research after graduation. A Graduate Research Scholarship in medicine, value £70, tenable for one year, awarded annually for proficiency shown at Final M.B. Examination. A Dumville Surgical Prize, value £15, awarded annually at graduation. The Tom Jones Memorial Surgical Fellowship, value £105, tenable for one year, usually awarded annually. The Turner Medical Prizes, value 10 guineas each, awarded annually for proficiency in certain subjects of the Final M.B., Ch.B. Examination. The John Henry Agnew Prize of £30, awarded annually for proficiency in the diseases of children. The Ashby Memorial Scholarship, tenable for one year (£100), for research in the diseases of children; offered triennially. Sidney Renshaw Prize in physiology; one offered annually (£15). Wild Prize in pharmacology (£10). The John Henry Agnew Fellowship in diseases of children, £120, offered triennially. Eliza Marple Holt Post-Graduate Medical Scholarship for Women, £60 for one year, offered biennially. The details and regulations of the Dickinson Scholarships—(1) for anatomy, (2) for pathology, (3) Research Scholarship in surgery, and (4) Travelling Scholarship in medicine—may be obtained from the Secretary to the Trustees. The Morrison Watson Fellowship for research in anatomy is offered annually, value £150; also the Sheridan Delepine Fellowship in preventive medicine, value £300, is offered biennially. The Sam Gamble Scholarships—the trustees are prepared to award four scholarships of not less than £40 per annum, tenable for not more than four years, to women students who have passed the First M.B. Examination; the conditions can be obtained from the Registrar. The Knight Prize of £50 for original research in the psychological factors in the causation of mental disorder—open to holders of the Diploma in Psychological Medicine or medical practitioners who have been registered in the university as candidates for that diploma.

Fees.—The composition fee for the university course in medicine is 114 guineas for men, 112 guineas for women, payable in four instalments of 28½ and 28 guineas respectively, but this sum does not include the fee to cover the work required for the First M.B. Examination. This is £42, payable in one sum. Hospital fees are additional, and usually amount to about 77 guineas.

A prospectus and further information about the school and scholarships may be obtained from the Registrar.

Clinical Work.—The Royal Eye Hospital, the Hospital for Diseases of the Skin, the Manchester Northern Hospital for Women and Children, the well-known Hospitals for Children at Pendlebury, and St. Mary's Hospitals for Women and Children, the Manchester Hospital for Diseases of the Ear, Monsall Fever Hospital, the Christie Cancer Hospital, the Hospital for Consumption and Diseases of the Throat and Chest, the Ancoats Hospital, and the Salford Royal Hospital, all make arrangements for the instruction of students.

SHEFFIELD.

IN this city the Medical School is one of the departments of the university, being conducted and controlled by its Medical Faculty, and occupying practically the entire north wing of the quadrangle of the university buildings overlooking Weston Park. The laboratories and lecture rooms

Royal Infirmary and University Pathological and Bacteriological Laboratory; tutorial classes of practice of physic, of clinical medicine, and clinical surgery, surgery and midwifery; and the practice of certain other hospitals.

Fees.—The sessional fee for chemistry, anatomy lectures, physiology, pathology, materia medica, surgery, medicine, and midwifery is £6 6s. each. Physics, botany, zoology, forensic medicine, and public health, £5 5s. Practical zoology, practical anatomy (summer), morbid anatomy, practical materia medica, mental diseases, practical pathology, clinical midwifery, and medical entomology and parasitology, £4 4s. Experimental physiology, diseases of tropical climates, practical botany, histology, operative surgery, clinical surgery (per term), clinical medicine (per term), and experimental pharmacology, £3 3s. Practical anatomy (winter), £6 16s. 6d. Practical chemistry, £4 14s. 6d. Regional anatomy, chemical physiology, surgical pathology, and infectious diseases, £1 11s. 6d. Tuberculosis, diseases of children, diseases of the eye, diseases of the larynx, ear, and nose, diseases of the skin, and venereal diseases, £2 12s. 6d. Advanced bacteriology, £7 17s. 6d. Clinical gynaecology and applied anatomy, £2 2s.

Scholarships.—There are many funds for the assistance of students by means of bursaries, scholarships, exhibitions, and money awards from the beginning to the end of their undergraduate career. In addition, there are funds which help those who have taken a first degree in medicine and surgery to continue at work as research students. The value of these awards, and the conditions attaching to them, are so varied that those interested should consult the prospectus of the school itself. No other university is in a better, even if as good, position to smooth the financial path of earnest students.

THE SCHOOL OF MEDICINE OF THE ROYAL COLLEGES.—This school is composed of lecturers licensed by the Royal College of Physicians and the Royal College of Surgeons, and also recognized by the university through their *licentia docendi*; for the sake of convenience they lecture in separate buildings near to the Royal Infirmary, but form a single corporate body governed by a board elected by the Royal Colleges of Physicians and Surgeons and by the Lecturers. This board, with the assistance of the standing committees of the school, supervises the whole management and especially the maintenance of the efficiency and discipline of the school. The different buildings at present utilized for the purposes of lecturing are the following: (1) Surgeons' Hall, Nicolson Street; (2) New School, Bristo Street; (3) Nicolson Square; (4) Marshall Street; and other places. The teaching is similar to that of the Scottish universities, and the students receive similar certificates at the close of each session. The courses on the special subjects are also conducted by teachers specially qualified in each branch, and have for the last quarter of a century formed a special feature of the school. The fees payable for class and other instruction, and including the sums payable on admission to the examination of the Conjoint Board for the triple qualification, amount to about £180. The Calendar, giving full information regarding classes and fees, can be obtained (price 6d.) on application to the Dean of the School, Surgeons' Hall, Edinburgh.

WOMEN STUDENTS IN EDINBURGH.—Until the close of the summer session of 1916 women students intending to proceed to graduation in the University of Edinburgh, as well as those entering for the triple qualification of the Royal Colleges of Edinburgh and Glasgow, received their training in the Edinburgh School of Medicine for Women. Now women students study under the same conditions as men, and may obtain either the university degree or the diploma of the Royal Colleges. In the university systematic lectures are given to them by the professors in the ordinary classes, which are therefore mixed. In clinical surgery, however, while the lectures are attended by mixed classes, the women students are restricted to the wards of one charge. The particular wards are changed every six months, each of the surgeons to the infirmary taking the women students in rotation. With few exceptions, prizes, scholarships, bursaries, and similar distinctions are open to women under the same conditions as for men. The women students also have the same privileges as in the past have been given to the men of attending a certain proportion of the extra-mural classes taught by the lecturers of the School of Medicine of the Royal Colleges. Most of the students' societies are open to women, with the exception of the University Union and the Royal Medical Society. Their place is taken by the Women Students' Union and the Women's Medical Society. There is also a Women's Athletic Club, with playing fields gifted to it by the university. The membership of the Royal College of Physicians and Fellowships of the two Royal Colleges are also open to women. Information on matters connected with women's studies may be obtained from the Adviser of Women Students, The University, Edinburgh.

GLASGOW.

THE UNIVERSITY SCHOOL FOR MEN.—The whole course of study required for graduation (M.B., Ch.B.) at the University of Glasgow can be taken here. Besides ample provision for lectures there is practical and clinical work at the hospitals, and practical courses are conducted in the laboratories of the following departments: pathology, public health, pharmacology, physiology, surgery, anatomy, chemistry, zoology, physics, and botany; the Botanic Garden and the Hunterian Museum (Pathology) are also open to students. Well-equipped new buildings have been provided for botany, zoology, practical anatomy, and operative surgery, as well as for pathology; the very large additions made a number of years ago to the chemical laboratory render it one of the most extensive in Scotland. The classrooms and laboratories for the departments of physics, physiology, pharmacology, materia medica, medical jurisprudence, and public health are also of recent erection, and are elaborately equipped. Four additional chairs of medicine, surgery, obstetrics, and pathology have been recently established, the professors being specially attached to the Royal Infirmary; and a number of university lectureships in clinical medicine, clinical surgery, venereal diseases, laryngology, dermatology, otology, psychological medicine, tuberculosis, pathological biochemistry, and electrical diagnosis and treatment have been founded there. Other chairs have been founded at the university in bacteriology, organic chemistry, physiological chemistry, applied physics, public health, and paediatrics. There are also lectureships on the surgical and medical diseases of children and on electrical diagnosis and therapeutics. The university, in short, has made great and successful efforts to extend and improve the accommodation of the medical departments, to strengthen the teaching staff, and to encourage post-graduation and research work. A diploma in public health is now also granted. Three very extensive general hospitals in the city afford exceptional opportunities for clinical instruction—namely, the Western Infirmary (600 beds), near the university, to which the Regius Professors are attached; the Royal Infirmary (782 beds); and the Victoria Infirmary (380 beds); while the Royal Mental Hospital, Gartnavel (500 beds), the Royal Hospital for Sick Children (290 beds), the Royal Maternity and Women's Hospital (114 beds), the Glasgow Eye Infirmary (100 beds), the Ophthalmic Institution (35 beds), the fever hospitals at Belvidere (680 beds) and Ruchill (540 beds), and other institutions afford facilities for the practical study of special branches. The large general hospitals of the parish council are now also available for clinical instruction in medicine and surgery. Information regarding post-graduate study will be found at page 387.

Bursaries.—Bursaries confined to the Medical Faculty amount in annual value to about £1,000, while bursaries in any faculty, amounting to about the same annual sum, may be held by students of medicine, a number of both sets being open to women. Several valuable scholarships may be held by medical students who have graduated in arts.

The following bursaries are open for competition to students entering on their first session of attendance in the Faculty of Medicine: Davidson Bursary, annual value £40, tenable for four years, for students who propose before entering the Faculty of Medicine to take the degree of B.Sc. in pure science, including in their curricula anatomy and physiology. Highland Society (Glasgow) Bursaries, annual value £25 each, tenable for five years, for students of Highland descent, open to women; two bursaries vacant each year. Logan Bursary, annual value £25, tenable for four years, open to women. Robina Eckford MacBrayne Scholarship, annual value £50, tenable for three years. Marshall Bursary, annual value £24, tenable for four years. Merchants' House Bursary, annual value £35, tenable for four years, open to women. John Oliphant Bursary, annual value £35, tenable for six years. James A. Paterson Bursaries, three each year of the annual value of £35, £25, and £15 respectively, each tenable for four years; students entering their second session are also eligible; open to women; examination in mathematics and natural philosophy.

Candidates for the aforementioned bursaries must take the university general bursary competition which is held each year in the month of June.

Particulars may be obtained from Mr. T. Mason Macquaker, M.A., Secretary, 200, St. Vincent Street, Glasgow.

ST. ANDREWS AND DUNDEE.

THE medical departments in these two teaching centres cater specially for students proceeding to the degrees of the University of St. Andrews, but admit other students as well. In the former city the United College provides education in all subjects for the first two years. In Dundee, University College provides for the needs of students from the beginning to the end of the five years' curriculum. Its buildings are modern, and contain fully equipped laboratories. The clinical work of the school is facilitated by various institutions. The class fees are from £6 6s. to £5 12s. 6d. for systematic classes, and from £4 14s. 6d. to £4 4s. for practical classes. The hospital ticket is £1 8s. for three months, £4 4s. a year, or perpetual, £13 6s. 8d. in one sum. The inclusive or composition fee for the curriculum is £182. In connexion with both institutions there are bursaries and scholarships of considerable value, which are awarded after competitive examination. Information as to these can be obtained from the Secretary of the University of St. Andrews. Information regarding the clinical facilities may be obtained from the Dean of the Medical Faculty, Medical School, Dundee.

Clinical Work.

Good opportunities for clinical work are afforded by the Dundee Royal Infirmary, the instruction given thereat being recognized for purposes of graduation by all the Scottish universities, the University of Cambridge, the University of London, the National University of Ireland, and by the Royal Colleges of England and Scotland.

IRELAND.

THERE is a choice of six schools for those pursuing their medical studies in Ireland. For clinical instruction the choice is equally wide and varied, though the hospitals themselves are comparatively small. Some account of the schools follows.

DUBLIN.

School of Physic.

THIS school is in Trinity College, Dublin, and is carried on under the joint auspices of the University of Dublin and of the Royal College of Physicians of Ireland, the King's professors of institutes of medicine (physiology), practice of medicine, materia medica, and midwifery being appointed by the latter. Clinical instruction is given at Sir Patrick Dun's Hospital, and some twelve other metropolitan hospitals and asylums are recognized by the Board of Trinity College. The courses of instruction are open to all medical students, whether they belong to the university or not.

The Schools of Surgery.

These are schools carried on in Dublin under the supervision and control of the Council of the Royal College of Surgeons. They are formed of the college's own school, combined with two famous old medical schools—Carmichael and Ledwich; they are attached to the college by charter. The buildings contain spacious dissecting rooms, special pathological, bacteriological, public health, chemical, and pharmaceutical laboratories. Advantage can be taken of the lectures and instruction afforded by students otherwise unconnected with the college.

Prizes.—Among the prizes annually awarded are: The Barker Anatomical Prize (£26 5s.); the Carmichael Scholarship (£15); the Mayne Scholarship (£8); the Gold Medal in surgery; the Stoney Memorial Gold Medal in anatomy; the H. Macnaughton Jones Gold Medal for midwifery and gynaecology; the Captain Massey Miles Memorial Prize; class prizes, accompanied by silver medals, will also be given in each subject. At intervals a prize of £150 is awarded, called the R. Dancer Purefoy Memorial.

A prospectus can be obtained post free on application to the Registrar, Royal College of Surgeons, Dublin.

University College, Dublin.

This is one of the constituent colleges of the National University of Ireland. The arrangements for the teaching of medical students from beginning to end of the curriculum are adequate. Applications for information may be addressed to the Secretary and Bursar, University College, Dublin.

Clinical Teaching in Dublin.

There are numerous well-arranged hospitals in and around the city, and almost all of these are recognized for teaching purposes by the Conjoint Board of Ireland, the University of Dublin, the National University of Ireland, and by like bodies elsewhere in the British Isles. Among them are the Mater Misericordiae Hospital, with 345 beds; Dr. Steevens's Hospital at Kingsbridge, with 150; Meath Hospital and County Dublin Infirmary, with 160; Mercer's Hospital, with 120; the Royal City of Dublin Hospital, with 124; the Adelaide Hospital, with 160; the Royal Victoria Eye and Ear Hospital, with 100 beds; Sir Patrick Dun's Hospital, which has a direct connexion with the School of Physic, and the combined institutions formed by the Hardwicke Fever Hospital, the Richmond Surgical Hospital, and the Whitworth Medical Hospital, with an aggregate of 330 beds.

As for the famous Dublin medical institution known as the Rotunda Hospital, this practically consists of two distinct hospitals, and is believed to be the largest combined maternity and gynaecological hospital in the British Isles. There are ante-natal and paediatric departments as well as a thoroughly equipped pathological laboratory, and *x*-ray apparatus. It possesses residential quarters for students, and, taken as a whole, offers exceptional opportunities for study both to ordinary students and to medical graduates of any nationality. During the past year 3,182 patients were admitted to hospital, this total being made up of 2,424 maternity cases and 758 gynaecological cases; 1,793 patients were attended at their own homes and 11,041 attended the dispensary.

Two other important obstetric and gynaecological hospitals in Dublin are the Coombe Lying-in Hospital and the National Maternity Hospital. During the year ending December 31st, 1929, the number of cases dealt with in the Coombe Lying-in Hospital were as follows: intern maternity department, total admissions 1,204; intern maternity department, total deliveries 1,080; extern maternity department, total deliveries 1,432; gynaecological department, number of operations 361.

At the National Maternity Hospital, Holles Street, Dublin, 1,413 patients were admitted to hospital during the year ending March 31st, 1930; total deliveries in hospital were 961; gynaecological operations 371; and dispensary attendances 7,843.

The practice of these hospitals is attended by large numbers of students, post-graduates, and nurses.

BELFAST.

THE Medical School is part of the Faculty of Medicine of Queen's University, Belfast, and provides a complete medical curriculum for all purposes. The laboratories in connexion with the departments of bacteriology, biochemistry, biology, chemistry, physiology, pathology, anatomy, physics, and materia medica are all excellent, and there is a students' union which gives students the advantages of dining rooms, reading rooms, a library, and various recreation rooms. Women are eligible as students. Clinical instruction is given at the Royal Victoria Hospital, which was rebuilt a few years ago and has 300 beds, and the Mater Infirmorum Hospital, which has 150 beds. Other hospitals open to the students of the university are: the Maternity Hospital, the Ulster Hospital for Women and Children, the Hospital for Sick Children, the Ophthalmic Hospital; the Benn Ulster Eye, Ear and Throat Hospital; the Union Infirmary and Fever Hospital; the Fever Hospital, Purdysburn; the District Lunatic Asylum, the Samaritan Hospital, Forster Green Hospital for Diseases of the Chest, and the Belfast Hospital for Skin Diseases.

Scholarships.—(1) Eight, of the value of £40 each, are assigned as Entrance Scholarships in the Faculties of Arts, Science, and Medicine, tenable for one year; (2) fourteen Professional Scholarships, value from £15 to £40 each; (3) one Hutchinson Stewart Scholarship, £12, in mental diseases; (4) one Mackay Wilson Travelling Scholarship, £100, awarded triennially; (5) Isabella Tod Memorial Scholarship, tenable for three years, awarded triennially

admit the holder once to all the lectures and classes, except those on physiotherapy and slit-lamp microscopy. The fee for a perpetual ticket to attend the practice of the hospital is £5 5s.; for three or six months, £3 3s.; for two months, £2 2s.; for one month, £1 1s. Registered medical practitioners and medical students are eligible, under certain conditions, for the posts of chief clinical assistant, clinical assistant, and junior assistant. There are also a number of salaried posts, an annual Clinical Research Scholarship of £50, and a biennial Gifford Edmonds Prize of £100. Clinical work begins each morning at 9 and operations at 10 o'clock. The course of instruction is specially adapted to meet the requirements of those reading for the D.O.M.S. and similar diplomas and degrees in ophthalmology. Further particulars may be obtained from the Dean of the Medical School. Other eye hospitals are the Royal Westminster Ophthalmic Hospital, now rebuilt on a new site in Broad Street, High Holborn, and containing 84 beds; the Royal Eye Hospital, Southwark, and the Central London Ophthalmic Hospital, Judd Street, W.C.1, each with about 40 beds; and the Western Ophthalmic Hospital with 18 beds.

Fever Hospitals.—The London County Council has under its control a number of institutions in and around London for the treatment of the more serious zymotic disorders; it makes special arrangements for the instruction of students in this subject, and grants certificates at the end of the courses. Detailed information should be sought from the Medical Officer of Health, Special Hospitals Division, London County Council, Victoria Embankment, E.C.4.

Chest Hospitals.—The largest of these is the Brompton Hospital for Consumption, which has 333 beds and a large sanatorium at Frimley with 150 beds. There is also the City of London Hospital for Diseases of the Chest, Victoria Park, with 185 beds, and the Royal Hospital for Diseases of the Chest, City Road, with 85 beds, now amalgamated with the Royal Northern Hospital, Holloway Road.

Nose, Throat, and Ear Hospitals.—The institutions which confine their work to disorders of the throat, nose, and ear all make special arrangements for the benefit of senior and post-graduate students. They are the Metropolitan Ear, Nose, and Throat Hospital, Fitzroy Square; the Royal Ear Hospital, Huntley Street, W.C.1 (now the Ear, Nose and Throat Department of University College Hospital); the Central London Throat, Nose, and Ear Hospital, Gray's Inn Road; and the Hospital for Diseases of the Throat, Golden Square—the last, which possesses 95 beds, being the largest of the four institutions.

Miscellaneous Special Hospitals.—Among these are the Bethlem Royal Hospital, now in course of transference from Kennington to a large new site at Eden Park, Beckenham, which (like the Maudsley Hospital) confines its work to the treatment of mental diseases, and includes a department for nervous and early mental disorders; the Royal National Orthopaedic Hospital, Great Portland Street; St. Peter's Hospital for Stone and Urinary Diseases, Henrietta Street, Covent Garden; St. Mark's Hospital, City Road, which devotes itself to the treatment of diseases of the rectum, including cancer and fistula; the National Hospital for Diseases of the Heart in Westmoreland Street, W.1; St. John's Hospital for Diseases of the Skin in Leicester Square; the Hospital for Diseases of the Skin, Stamford Street, Blackfriars; the National Hospital, Queen Square, W.C.1, an institution possessing 200 beds for neurological cases and a world-wide reputation; and the West End Hospital for Nervous Diseases, 73, Welbeck Street, W.1.

Detailed information as to the teaching arrangements of all these institutions may be obtained on application to their secretaries.

WOMEN IN MEDICINE.

THE regulations of the General Medical Council and of the various universities and colleges set out in previous sections apply to women as to men.

EXAMINATIONS.

Women are admitted to all the medical examinations of the following qualifying bodies: all the universities of Great Britain and Ireland; the Royal College of Physicians of London; the Royal College of Surgeons of England; the Society of Apothecaries of London; and the Conjoint Boards of the Royal Colleges in Scotland and in Ireland. In addition, women are eligible for election as Fellows of the Royal College of Physicians of London and the Royal College of Physicians of Edinburgh.

MEDICAL EDUCATION.

The general tendency during the years since the war has been to admit women to train in medicine at the same schools and under very much the same conditions as men. In this country at the present time co-education is the general rule. The schools of the London hospitals have, however, so far shown themselves more conservative in this respect than the rest of the country.

In England the colleges connected with the universities of Birmingham, Bristol, Cardiff, Leeds, Liverpool, Manchester, Newcastle, and Sheffield admit women students as well as men, whilst in Scotland the universities of Aberdeen, St. Andrews, Edinburgh, and Glasgow also admit women. In Ireland all universities and colleges are open to them.

Although in London the only schools open to medical women students are the London School of Medicine for Women and, to a modified extent, University College Hospital, it is felt that such a state of affairs can only be temporary, and hopes can be entertained that in the near future the principle of co-education will prevail in the capital.

At the present time it will be seen that the only co-education hospital in London is that of University College—the number of women entrants is restricted to twelve a year, but these twelve (making between thirty-six and forty-eight training at any one time for the three to four years' clinical course) are given excellent opportunities whilst students, and also, in fair proportion, are given opportunities of post-graduate experience as residents—house-surgeons, house-physicians, and obstetrical assistants.

NUMBER OF WOMEN MEDICAL STUDENTS.

Returns made to the University Grants Committee at the end of 1929 showed that the total number of full-time women medical students attending university institutions in England, Scotland, and Wales during the past five years were:

	1924-25.	1925-26.	1926-27.	1927-28.	1928-29.
England	1,197	1,059	930	862	824
Wales	32	30	32	30	14
Scotland	431	313	274	254	270
Total	1,650	1,402	1,236	1,146	1,108

THE LONDON (ROYAL FREE HOSPITAL) SCHOOL OF MEDICINE FOR WOMEN.

The London (Royal Free Hospital) School was started for the training of women in medicine in the days before there were any co-education facilities for them, and it still remains by far the largest school for women. In addition to the clinical work at the Royal Free Hospital, which at present has 268 beds, but will shortly have 360 when the extensions now in progress are completed, arrangements are made for students of the school to obtain clinical instruction at the National Hospital for Nervous Diseases, Queen's Square; the Royal London Ophthalmic Hospital, Moorfields; the Great Ormond Street Hospital for Children; the Elizabeth Garrett Anderson Hospital; the South London Hospital for Women; and the Cancer Hospital. Its importance for women in medicine can hardly be overestimated, not merely because it was the pioneer which made the way possible, but also because it is still the only general hospital in Britain which offers all its post-graduate appointments, higher and lower, to open competition by women as well as men, thus giving unique opportunity of gaining experience. Not only are all the resident appointments at the Royal Free Hospital, of which there are twenty-seven yearly, eligible for women, but, in addition, higher posts may be obtained in all the various branches of a general hospital, from those of registrar and anaesthetist to those of visiting physician or surgeon and those in charge of special departments. There is a special unit in gynaecology under a woman professor, and entirely staffed by medical women. This policy has so far not been fully adopted in its entirety by any other hospital, and it may be of interest to note in this connexion that the Royal Free Hospital has many women on its general committee and weekly board of management.

OPENINGS FOR MEDICAL WOMEN.

There are at the present time the names of over three thousand medical women on the *Medical Register*. There is an increasing demand by the public for the services of women doctors in all branches of medicine, and statistics show that the number of those who make good is as high as, if not somewhat higher than, that of their men colleagues.

OPENINGS AT HOME.

Since the number of men and women qualifying has reached normal standards, medical women on qualification find no difficulty in obtaining house appointments in the recognized teaching hospitals and in non-teaching hospitals, hospitals for women and children, sanatoriums, etc.

General Practice.—There are good openings as assistants or, better still, as assistants with a view to admission as partners in general practice. Medical women also do very well when starting in new districts; and there is considerable scope for them in midwifery work.

Specialist and Consulting Practice.—The number of women doing specialist and consultative practice grows rapidly. There is no branch of medicine in which it is not possible for a patient to consult a medical woman. Women so specializing equip themselves by obtaining the highest essential qualifications, and it is hoped that the time is not far distant when many more women will hold positions on the honorary staffs of all hospitals. Already medical women are on the honorary staff of the Royal Free Hospital, London, and of general hospitals in a number of provincial cities. In London, Edinburgh, Glasgow, Manchester, and Brighton there are hospitals staffed entirely by medical women, doing very fine work and meeting a real need, the latest to be opened being the Marie Curie Hospital in London for the treatment of cancer by radium. Research work also provides interesting openings, as, for example, in dealing with the special problems concerning cancer, nutrition, puerperal morbidity and mortality, statistical work, etc., and for some of these research scholarships and grants are available.

Teaching Posts.—Women hold professorships and lectureships at various universities.

Industrial Medicine.—In this branch there is much interesting work available, and it is undergoing considerable development at the present time. Several women already hold such posts.

Administrative Work.—A certain number of these important posts are admirably filled by medical women. The chief medical officer for maternity and child welfare is a medical woman, and has a staff of medical women to assist her.

The Public Health Service.—This service provides numerous openings for medical women. It has many departments, and its rapid growth in recent years has provided much interesting work in preventive medicine. In this connexion it may be noted that a medical woman has recently been appointed medical officer of health to a large borough council, and senior departmental posts are frequently held by medical women. For maternity and child welfare work women have been found to be peculiarly suited, but, by a curious economic limitation, married women, who would appear to be the most suitable of all, are, by many public authorities, excluded from service. This exclusion not only prevents married women from taking part in this work, but also prevents many of the best women from specializing in this branch of medicine, as it is obviously uneconomic to specialize in a branch of public service from which one may be excluded in a few years.

Medical Inspection, etc.—Under the Board of Education there are women serving as medical advisers and school medical inspectors. The London County Council and other important councils in the country have medical women on their permanent medical staffs, in both the senior and junior grades. The London County Council has two of its senior medical women appointed to serve as district medical inspectors. In addition, they have a large number of women medical inspectors of school children, and also women are serving as experts in the departments dealing with mental deficiency, tuberculosis, and venereal disease. Some medical women also serve as examiners of the candidates entering the public services, as, for example, the civil service. The services of medical women are extensively enlisted by public authorities in dealing with employees of their own sex. In several instances women serve as assistant medical officers to prisons. The services of medical women are also enlisted as lecturers and examiners on first aid, home nursing, health, and infant care.

PAY AND STATUS.

It is interesting to note that medical women, backed by the powerful assistance of the British Medical Association, have been on the whole successful in resisting the attempt to accept a lower salary for the same work as their men colleagues, thereby not only greatly benefiting themselves, but also maintaining the standard for the whole profession. They realize that ever since the admission of women to the medical profession exactly the same sacrifices for principle have been made by their predecessors as are now demanded from them. With the inauguration of the School Medical Service in 1908, and later when maternity and child welfare posts were created, persistent efforts were made by local authorities to pay their assistant medical officers below the minimum arranged by the representatives of the public authorities and the British Medical Association, and to secure women at a lower rate than men. With rare exceptions these efforts were a failure. Women realize as clearly as men that lowered pay invariably implies a lowered status and prestige, and that the woman who stamps herself as belonging to an inferior grade of doctor cannot complain if she is taken at her own valuation, and that a minimum always tends to become a maximum. Attempts to evade the scale and split the ranks of the profession by offering a post to a man at the agreed rate and a similar post to a woman slightly below that rate are particularly to be deprecated. Where the rule of equal pay for equal work is violated there is no limit to the extent to which women may be exploited and sweated.

OPENINGS ABROAD.

Colonial Office.—To those to whom oversea service appeals it offers the possibility of useful, interesting, and adequately paid work. At present there are posts for women in Malaya, and East and West Africa. The work is almost entirely hospital and maternity and child welfare work there have been one or two specialist appointments, such as bacteriologists, and more may follow. Women have, so far only been appointed to the lower grade posts, but their pay is the same as that of the men in similar grades. When placed on the permanent staff they are eligible for pension

Egypt.—Appointments in the Kitchener Memorial Hospital, Cairo, which forms part of the Clinical Faculty of the University of Cairo, are held by women. Appointments in certain dispensaries are open to medical women. There are also posts held under the education authority, chiefly school medical inspection.

India.—See note on the Women's Medical Service for India on page 384

Mission Field.—Missionary societies offer employment to medical women, chiefly in India, China, and the Near East.

PUBLIC ACTIVITIES.

Medical women are frequently appointed to serve on Royal Commissions and Government Committees dealing with medical subjects, and are also requested by them to give evidence of an expert medical nature.

Medical women have always shown considerable interest in medico-political affairs, and take an active part in the work of the British Medical Association, and with the various other societies dealing with medicine as it affects the community in general. With this end in view they also have a Medical Women's Federation, which enables them to voice a collective expression of opinion. This might otherwise be difficult to ascertain, as women are so widely scattered, both as regards their geographical distribution and their varied activities. This collective opinion of medical women has been found of great assistance by the British Medical Association and other allied societies with which it works in cordial co-operation and by whom it is frequently approached, both for information and also as a convenient means of approaching medical women as a whole.

It may be added, with regard to contributions to medical literature, that this is a branch of work in which women are more and more taking their share, and scientific and other works are frequently published by them.

WOMEN'S MEDICAL SERVICE FOR INDIA.

AMONG careers open to medical women abroad the Women's Medical Service for India deserves honourable mention. This service is open to fully qualified medical women of British or Indian nationality. With the present amount of Government subsidy the number of medical officers is limited to 44.

Medical women proceeding to India to join the Women's Medical Service receive a sufficient sum for a first-class passage to India. On landing they are posted to one of the larger women's hospitals to gain Indian experience and to learn the language. For a further period they are appointed to act temporarily for medical women on furlough. They are then definitely appointed to the charge of hospitals. Private practice is allowed, provided it does not interfere with official duties. The only exception is in administrative or educational posts, when an allowance in lieu of practice is given. The amount obtained by practice varies according to the station, but in most cases it forms a fair addition to the salary, varying from £150 to £1,000 a year.

Excellent opportunities for surgery—especially gynaecological—are found in the Women's Medical Service. For those who are not keen surgeons opportunities are likely to occur in the future in connexion with maternity and child welfare. Rates of pay are as follows:

Years of Service.	Rates of Pay per mensem.	Annual Salary.
1-3	Rs. 450	£1440
4-6	Rs. 500	£480
7-9	Rs. 550	£520
10-12	Rs. 600	£560
13-15	Rs. 650	£600
16 18	Rs. 700	£640
19-21	Rs. 750	£680
22 24	Rs. 800	£720
Over 24	Rs. 850	£760

Furnished quarters are provided, representing an addition of Rs. 150 *per mensem. The oversea allowance of Rs. 100 per mensem rises to* Rs. 150 after twelve years' service. The value of the rupee is taken at 1s. 4d.

The cost of living in India is much higher than formerly, but it should be possible for a medical woman (with house provided) to meet actual household expenses on about Rs.300 per mensem, leaving the remainder of her salary for dress and personal expenses. To this must be added the necessary saving to meet additional expenses for furlough and leave spent in the hills.

Leave on average pay is earned at the rate of two-elevenths of the period spent on duty.

Study leave may be granted to the extent of twelve months in the total service, and will not be granted more than twice in the course of an officer's service. During study leave an officer draws half her average pay, with a study allowance at the rate of 12s. a day during the course of study.

Officers of European domicile are entitled to four free return first-class passages from a port in India to a port outside India during their whole period of service. The first passage is not granted until four years' approved service has expired, and thereafter passages may be granted at intervals of not less than four years.

There is a Provident Fund to which members of the service contribute 10 per cent. of their pay. The service contributes another 10 per cent., which accumulates at interest and is repaid on retirement.

Admission to the service is made by selection in India and England, preference being given to those with Indian experience. Vacancies are few. Candidates in the United Kingdom should apply to the Secretary, U.K. Branch of the Countess of Dufferin's Fund, c.o. Lieut.-Colonel Sir Leonard Rogers, India Office, Whitehall, S.W.1.

POST-GRADUATE STUDY.

NOTWITHSTANDING the large and varied amount of material available, post-graduate study in London suffers from several disabilities, which have become increasingly obvious during recent years. In the first place, teaching centres are widely scattered, and it is not easy for the student to obtain everything he requires under one roof, or even in the same district. Secondly, no definite post-graduate school exists at which the graduate can obtain directions for a course to suit all his needs. Thirdly, there is no recognized hostel or meeting place to which the student can resort for social purposes. While several institutions in London have endeavoured to meet one or other of these needs, their efforts have been on a small scale, and it has long been apparent that "the post-graduate habit" would not be developed until a centre for post-graduate medical education had been established.

Post-graduate students may be divided into general practitioners desirous of refresher courses to bring their general knowledge up to date; those who wish for instruction in special subjects with a view to obtaining one of the special diplomas, or of preparing for examination for promotion in one or other of the services, or—if already general practitioners—of adding some form of specialism to their work; and finally, visitors from the Dominions or abroad anxious to study the methods of British experts. As things stand at present, the general practitioner may perhaps find a refresher course at the hospital at which he was trained, held during a vacation, and designed specially to bring his knowledge up to date; or he may approach the Fellowship of Medicine, which was amalgamated with the Post-Graduate Medical Association in 1919, and has an office generously placed at its disposal by the Royal Society of Medicine at 1, Wimpole Street, W.1. At this office a list of hospitals, special and general, to which medical graduates may resort, with or without fee, is kept, and the names of the teachers at each hospital are available. Definite courses of study at individual hospitals are also organized by the Fellowship. The West London Hospital at Hammersmith, and the Prince of Wales's General Hospital at Tottenham, have for many years had post-graduate colleges attached to them, thus overcoming, to the extent of their resources, the disabilities mentioned above. Courses of lectures and instruction for qualified practitioners are given at many special hospitals; and in the London School of Hygiene and Tropical Medicine, Keppel Street, Gower Street, opened last year, it is possible to obtain under one roof instruction in all branches of preventive medicine. The work of the school has been arranged in the following divisions: public health, including a section devoted to the physiology of hygiene; epidemiology and vital statistics; bacteriology and immunology; biochemistry, including a department for chemistry as applied to hygiene; medical zoology, embracing the departments of protozoology, helminthology, and entomology; and, finally, tropical medicine and hygiene, of which the Director, Sir Andrew Balfour, has charge, and which embraces clinical work in diseases of the Tropics, for which facilities are afforded by the Hospital for Tropical Diseases in Gordon Street.

In the provinces the Universities of Oxford, Cambridge, Birmingham, Bristol, Liverpool, Manchester, and Sheffield have organized courses. Edinburgh receives graduates from many schools in the Dominions as well as in this country. In Glasgow and Aberdeen courses are available; and in relation with the University of St. Andrews courses are given by the staff of the James Mackenzie Institute for Clinical Research. At many of these centres the teaching is provided by way of whole-time intensive courses, by part-time courses, or by means of clinical assistantships. The Joint Tuberculosis Council has provided nomadic courses in its own special subject.

Short particulars about the facilities for post-graduation study at present obtainable in Great Britain and Ireland are given in Section VI of the *Handbook for Recently Qualified Practitioners* published by the British Medical Association (price 3s. 6d.).

BRITISH POST-GRADUATE HOSPITAL AND SCHOOL.

During the past few months a very important step has been taken towards remedying the defects indicated in the opening paragraph of this section. As long ago as 1921 a committee under the chairmanship of the Earl of Athlone was set up by Dr. Addison when Minister of Health. The ground was rapidly surveyed and proposals were submitted, but the chief recommendation, for "a school attached to a hospital centrally situated in London devoted solely to post-graduate medical education, as a school of the University," remained unfulfilled. In 1925 Mr. Neville Chamberlain appointed a second committee with a single clear-cut reference: "To draw up a practicable scheme of post-graduate medical education centred in London." The report of this representative committee was issued in April last, and the scheme it unanimously put forward has been accepted by the Government. The

contents of the report were summarized in the *British Medical Journal* of April 19th (p. 745).

Briefly stated, the "practicable scheme" finally arrived at, after weighing many alternatives, is for the establishment of a British Post-Graduate Hospital and Medical School, comprising a hospital with 400 bed a medical school, and residential facilities for students, by converting the Hammersmith Hospital at Shepherd's Bush. This modern institution, now under the control of the London County Council, has the 400 beds needed at the outset. To complete the scheme a fully equipped medical school will have to be built on the 14-acre site, and a hostel for graduate students established in central London. The Government, impressed with the urgency of the need and the feasibility of the plan, has pledged itself to contribute from public funds a maximum capital sum of £250,000 for building and equipping the post-graduate school, and beyond this to provide annual grants towards its upkeep through the University of London. The committee assumed that the cost of maintaining the hospital would fall, as at present, on the ratepayers. For the hostel money must be found by way of a public appeal, which has since been issued.

A great step forward has thus been taken. A comprehensive and practicable scheme has been framed, a site and money have been found, and if the several parties to the undertaking work harmoniously, with one goal in view, the capital of the British Empire will become in time a world-centre of post-graduate medical training. The site chosen, though accessible, is not perhaps as central as could be wished, but it is fully large enough to contain the school buildings and to allow of additions to the existing hospital. Further, an essential point made by the Athlone Committee—that the central post-graduate medical school, when established, should be a school of the University of London—has been recognized and accepted by the Government.

The Minister of Health, after consultation with the London County Council and the Senate of the University of London, has now appointed a Provisional Organization Committee to proceed with the action necessary to secure the establishment of the British Post-Graduate Hospital and Medical School. The terms of reference of this committee are to consider and report, in pursuance of the statement made by the Minister of Health in the House of Commons on April 9th, upon (1) the action requisite to lead up to the planning and construction of the medical school, and (2) the form of government appropriate to the hospital and medical school, with special reference to the position of the London County Council as the local authority responsible for the hospital, and to the position of the University of London in relation to the medical school.

The chairman of the committee is Viscount Chelmsford. The Ministry of Health is represented by Sir George Newman, chief medical officer, and Mr. M. Heseltine, an assistant secretary; the London County Council by Dr. Florence Barrie, Lambert, Sir William Ray, Mr. Angus N. Scott, and Mr. L. Silkin; and the University of London by the vice chancellor, the chairman of convocation, Mr. H. L. Eason, superintendent and senior ophthalmic surgeon, Guy's Hospital, and Dr. Edwin Deller, principal of the university. The other members of the committee fall of them members of the medical profession) are Mr. Donald J. Armour, senior surgeon, West London Hospital, Lady Barrett, dean of the London (Royal Free Hospital) School of Medicine for Women; Mr. Comyns Berkeley, obstetric surgeon, Middlesex Hospital; Sir Robert Bolam, physician to the Skin Department, Royal Victoria Infirmary, Newcastle on Tyne, and past Chairman of Council, British Medical Association; Dr. H. B. Brackenbury, Chairman of Council, British Medical Association; Mr. H. W. Carson, senior surgeon, Prince of Wales's General Hospital, Tottenham, Dr. H. G. Dain, chairman of Insurance Acts Committee, British Medical Association; the Right Hon. Lord Dawson of Penn, physician, London Hospital; Dr. H. R. Dean, professor of pathology, Cambridge University; Sir Walter M. Fletcher, secretary of the Medical Research Council, Mr. G. E. Gask, professor of surgery, London University, and surgeon, St. Bartholomew's Hospital; Sir Thomas Horder, Bt., physician, St. Bartholomew's Hospital; Dr. T. N. Kay Menzies, medical officer of health for the County of London, Lord Moynihan of Leeds, President of the Royal College of Surgeons of England, consulting surgeon, Leeds General Infirmary, Mr. H. J. Paterson, senior surgeon, London Temperance Hospital, and honorary secretary, Fellowship of Medicine and Post-Graduate Association; Dr. Harold Pritchard, senior physician, West London Hospital; and Sir Holburt Waring, senior surgeon, St. Bartholomew's Hospital.

Mr. Heseltine is acting as secretary, and all communications on the business of the committee should be addressed to him at the Ministry of Health, Whitehall, S.W.1.

FELLOWSHIP OF MEDICINE AND POST-GRADUATE MEDICAL ASSOCIATION.

The Fellowship of Medicine has arranged regular courses in general medicine and surgery, including special departments, each lasting two weeks, the fee for each course is 5 to 5 guineas. Courses in diseases of the chest, children, ante-natal, heart, nervous system, throat, nose, and ear; dermatology, gynæcology, proctology; psychological medicine; tropical medicine, urology, and venereal diseases are given from time to time at the special hospitals in association with the Fellowship of Medicine. Evening courses for the M.R.C.P. and F.R.C.S. (Final) are arranged also. The Fellowship "General Course" Programme contains a diary of the arrangements available for post-graduates in various general and special hospitals in London. The list for the immediate future special courses includes a two weeks' course in general medicine and surgery, from September 15th to 27th, at the Westminster Hospital; in diseases of children, at the Queen's Hospital, from September 16th to October 11th. The office of the Fellowship is, by kind permission of the Royal Society of Medicine, at No. 1, Wimpole Street, W.1 (telephone, Mayfair 2235). The secretary is in attendance daily from 10 a.m. to 5 p.m., excepting Saturday. The annual subscription for membership of the Fellowship of Medicine and Post-Graduate Medical Association has been fixed at a minimum of 10s., which includes the subscription to the *Post-Graduate Medical Journal*.

The Fellowship arranges, during the autumn and winter sessions, a series of lectures. Special clinical demonstrations in medicine and in surgery are arranged also weekly from October onwards. Syllabuses will be sent regularly on application.

NATIONAL POST-GRADUATE SCHOOL OF RADIOTHERAPY.

It was announced in our issue of June 28th (p. 1185) that a working scheme had recently been drafted for affiliation between the London Radium Institute in Riding-house Street, and the Mount Vernon Hospital at Northwood, for the establishment, under joint control of a National Post-Graduate School of Radiotherapy. The first of a series of intensive courses in radiotherapy will commence on Monday, October 6th. Applications for copies of the syllabus and other information may be addressed to the Dean (Sir Cuthbert Wallace, K.C.M.G., F.R.C.S.) at the National Post-Graduate School of Radiotherapy (the Mount Vernon Hospital and Radium Institute), Ridinghouse Street, London, W.1.

WEST LONDON POST-GRADUATE COLLEGE.

The work of this institution is carried on at the West London Hospital, the first in London to devote its clinical material solely to the instruction of qualified medical men. The college started in 1895, it is provided with lecture, reading, writing, and class rooms, and accommodation of all sorts for the convenience of post-graduate students. The work of the college is eminently suitable for men in general practice and officers in the services who wish to revive their general clinical knowledge.

As for ward work, the students accompany the senior staff on their visits to the wards at 2.30 p.m. daily, and also go round with the resident medical officers in the morning. Out-patient work begins at 2 p.m. This department is large, and affords ample facilities for post-graduates to see and examine patients. There are the usual special departments. Post-graduates are appointed to act as clinical assistants for three or six months, no charge being made. Special practical classes are held in medicine, general practical surgery, gastro-intestinal surgery, medical and surgical diseases of children, analysis of blood and urine, cystoscopy, venereal diseases, tropical diseases,

retinoscopy, ophthalmic operative surgery, and, when material is available, in operative surgery. The size of the classes is limited. A special clinic for the treatment of venereal diseases (male and female) is held all day. Graduates are admitted to the work of the clinic free, and certificates of satisfactory attendance and work are given.

Operations take place at 2 p.m. daily, the surgeons often availing themselves of the assistance of the graduates, and in any case making arrangements so that they can readily see what is going on. The anaesthetists give instruction in the administration of anaesthetics, including spinal analgesia, on the operating days, students being allowed to administer them under supervision, while special classes are held in each session. The pathological laboratory is in charge of a pathologist, who attends every day.

Demonstrations are ordinarily given in the morning by the assistant physicians and surgeons, and by the medical and surgical registrars.

Fees.—Hospital practice, including all ordinary demonstrations and lectures, £1 1s. for one week, £4 4s. for one month, £7 7s. for two months, £9 9s. for three months, £15 15s. for six months, £23 12s. 6d. for one year, and £45 for a life ticket. Instruction in the administration of anaesthetics is given at the rate of £3 3s. a month.

The certificates of the school are recognized by the Admiralty, the War Office, the Colonial Office, the India Office, and the University of London (for higher degrees). A prospectus can be obtained on application to the Dean.

North-East London Post-Graduate College.

The headquarters of this post-graduate school are situated at the Prince of Wales's General Hospital, Tottenham, N.15, in the midst of this densely populated North London district. It contains 200 beds, and is within a few minutes' walk of South Tottenham Station on the London Midland and Scottish Railway, and Seven Sisters and Tottenham Hale Stations on the London and North-Eastern Railway. It is readily accessible by electric tram from Finsbury Park and Hackney, and from Dalston, Edmonton, and other parts of North London. The North Middlesex Hospital, Edmonton, N.18, with upwards of 1,000 beds, has, under a recent arrangement, taken part in the clinical teaching.

The college is in association with the Fellowship of Medicine and Post-Graduate Medical Association, and is recognized by the Admiralty and India Office for the purpose of study leave, and by the University of London as a place for advanced study for the M.D. and M.S. degrees; the course of practical teaching of bacteriology is approved by the University of Cambridge for its Diploma in Public Health, and there are ample arrangements for the convenience of men who are thus working, or who, being in active practice, are desirous of getting themselves into touch with modern methods. The hospital as a whole affords excellent facilities for qualified medical practitioners who wish to take part for a time in active general hospital work, or to obtain special instruction in the several branches of medicine and surgery, since it is open to them to study diseases of the eye, ear, throat, nose, skin, fevers, children's diseases, psychological medicine, dental surgery, radiography, the application of electricity in disease, and the administration of anaesthetics. Throughout the sessions, into which the year's work is divided, clinics, lectures, and demonstrations are given by members of the teaching staff. Operations are performed every afternoon of the week except Saturday. Special vacation or intensive courses are held at intervals throughout the year, each lasting two weeks, clinical instruction being arranged for each hour of each day.

Fees.—For the hospital practice in general medicine or surgery the fee is 5 guineas for three months or 2 guineas for one month. Provided there is accommodation in the special departments, the fees are: eye department 3 guineas; gynaecological department 5 guineas; ear, nose, and throat department 5 guineas for three months. All departments—the fee is 3 guineas for one month, 6 guineas for three months, 10 guineas for a year, and 15 guineas for a perpetual ticket.

The winter session will be opened about the middle of September as regards clinical teaching.

Additional information can be obtained from the Dean of the Post-Graduate College, at the Prince of Wales's Hospital.

Manchester Post-Graduate Courses.

The Faculty of Medicine of the University of Manchester has arranged courses in preparation for the diplomas in psychological medicine, in public health, bacteriology, and veterinary State medicine. There are classes also for certificates in factory and school hygiene and in venereal diseases. The Faculty of Medicine has also instituted courses to meet the requirements of graduates desiring to refresh their knowledge or to pursue further their studies in various special branches. The arrangements are in the hands of a committee consisting of certain members of the faculty, of representatives of hospitals, and of the medical officer of health for Manchester. Full particulars can be obtained from the Dean of the Medical School, the University, Manchester. Part-time courses will be given during 1930–31 in diseases of the eye, diseases of the skin, practical instruction in local anaesthesia and minor operative surgery, and in bacteriology and immunity. A limited number of clinical assistantships are offered in the medical, surgical, and special departments of the Manchester Royal Infirmary, the Ancoats Hospital, and certain special hospitals for one, two, or three months, or longer. A clinical assistantship at the Radium Institute for three months is also offered. Clinical teaching for post-graduates is given each Thursday during university terms by the honorary staff at Ancoats Hospital; no fee charged.

Post-Graduate Courses at Bristol.

The University of Bristol provides courses of post-graduate study for practitioners. Details of set courses at the Royal Infirmary and General Hospital are announced locally. In addition, practitioners may become clinical assistants in medicine, surgery, or special subjects for periods of a month or more.

Daily Post-Graduate Study.—For those who are able to devote several hours each day to hospital practice the university offers special facilities for post-graduate work. Qualified medical practitioners may be appointed as clinical assistants for a period of one or more months. They may act as assistants, if times permit, in more than one department and in any of the hospitals during their period of study. They will be entitled to the use of the clinical laboratories and medical library, and have the right to attend in all departments, including operations, post-graduate and ordinary clinical demonstrations, and post-mortem examinations.

All inquiries and applications for admission should be addressed to the Director of Post-Graduate Studies (Clinical Section), Pathological Department, University of Bristol, who can be seen on any day by appointment at the Pathological Department.

Post-Graduate Courses at Newcastle.

For the year 1930–31 the following post-graduate courses have been arranged by the College of Medicine, Newcastle-on-Tyne (University of Durham):

1. General courses in clinical medicine, surgery, and pathology at the Royal Victoria Infirmary, meeting once weekly for ten weeks. One course will be held from October to December, and one from April to June.

2. Special courses of clinical instruction meeting once weekly for ten weeks in the following subjects: gynaecology, diseases of the eye, diseases of the throat, nose, and ear, diseases of the skin, venereal diseases, neurology. Special courses in midwifery will be held at the Princess Mary Maternity Hospital.

3. An intensive course of fourteen days' duration in the summer vacation, 1931.

4. In addition to the regular post-graduate courses practitioners may attend the ordinary medical and surgical practice of the Royal Victoria Infirmary, and also at the Princess Mary Maternity Hospital, for specified periods.

Edinburgh Post-Graduate Courses.

In connexion with the University and Royal Colleges post-graduate courses are arranged every year, from about the middle of July to about the middle of September, comprising: (*a*) a course in obstetrics, gynaecology, and diseases of children, held from July 14th to August 9th; (*b*) a general practitioners' course; (*c*) a general surgical

course. Courses (*b*) and (*c*) extended for four weeks from August 11th to September 6th. Similar courses are held each year.

The course in obstetrics, gynaecology, and diseases of children comprises instruction in clinical midwifery and clinical gynaecology, obstetrics and gynaecological pathology, diseases of children, child welfare, and ante-natal clinics, etc.

The general practitioners' course includes lecture-demonstrations, and, where possible, practical instruction on medical anatomy, medical sideroom work, examination of the blood, *x*-ray and electrical therapy, morbid anatomy, and post-mortem examination, clinical instruction in medicine, surgery, gynaecology, diseases of children, diseases of the skin, and infectious diseases, and special instruction in the diseases and methods of examination of the nervous, circulatory, respiratory, alimentary, and renal systems, and in diseases of the ductless glands. The general surgical course includes lecture-demonstrations on surgical anatomy, surgical pathology, and surgical *x*-ray diagnosis, clinical instruction in surgery at the Royal Infirmary and Royal Hospital for Sick Children, clinical instruction in venereal diseases; surgical out-patients, surgical and gynaecological operations, and special instruction in abdominal and genito-urinary and other branches of surgery.

A series of special lectures, open to all graduates, is delivered on subjects of general medical and surgical interest, including recent advances in treatment. Among the special courses also arranged are: examination of the blood, vaccine therapy, medical chemistry, diseases of the ear, nose, and throat, pathology of the nervous system, ophthalmo-copy, venereal diseases, and *x*-ray physics and electrotechnics.

Particulars regarding the courses, dates of commencing, fees, etc., may be had on application to the Honorary Secretary, Post-Graduate Courses in Medicine, University New Buildings, Edinburgh.

Post-Graduate Medical Teaching in Glasgow

Organized post-graduate medical teaching is available in Glasgow under the auspices of the Post-Graduate Medical Association. This association represents practically all the teaching institutions in Glasgow and the various teachers giving post-graduate instruction, and its business is managed by a board elected periodically by them. The chairman of the board is Professor Robert Muir. During the winter months special courses in various subjects are conducted, and from November till May there is a series of weekly demonstrations specially designed for local practitioners. Clinical courses are carried out during the summer months, and arrangements have also been made whereby a limited number of graduates may become attached to wards or out-patient departments nominally as clinical assistants for definite periods throughout the year. As such they work under the direct supervision of the physician or surgeon in charge, and carry out such detailed investigations as directed.

A general medical and surgical course is held each year during the last two weeks of August and the first two weeks of September, which is arranged to include most of the subjects of interest to the general practitioner. This year the course is being conducted from August 18th to September 12th. The forenoons are occupied with general medicine and surgical diagnosis and minor surgery, in the Western Infirmary and in the Royal Infirmary. In the afternoons special subjects are dealt with in the special hospitals and in the special departments of the general hospitals, two subjects being considered most afternoons.

Further information may be had on application to Dr. James Carslaw, Secretary, Post-Graduate Medical Association, 9, Woodside Terrace, Glasgow, C 3.

Australian and New Zealand Medical Association.

The Australian and New Zealand Medical Association gives information and advice to medical visitors from the Commonwealth and Dominions with regard especially to attendance at special clinics, post-graduate work, and facilities for preparing for examinations such as the M.R.C.P., F.R.C.S., etc., and also as to house appointments and clinical assistantships in London and the provinces. Information will also be given about lodgings, sports, and social opportunities. Two dinners are held annually. All medical graduates of undergraduates born in Australia or New Zealand and resident in or visiting England are eligible to become members. The fee is one payment of 5*s*. Further information can be obtained from the joint honorary secretaries, Mr. E. T. C. Milligan, F.R.C.S., 86, Harley Street, W., and Mr. Philip J. Jory, F.R.C.S., 26, Queen Anne Street, W.

TROPICAL MEDICINE.

There are large and important Schools of Tropical Medicine in London and Liverpool, and the Colonial Office expects all nominees for the Colonial Medical Service to pass through one or other of the two schools mentioned before their appointments are confirmed, and commercial firms engaged in tropical enterprise commonly demand from medical applicants for employment corresponding evidence of special knowledge. Information with regard to these schools and diplomas and degrees is given in the paragraphs printed below. Further particulars will be found in the *Guide to Regulations, Courses, and Qualifications in Public Health and Tropical Medicine and Hygiene*, compiled by Sir Andrew Balfour, Director of the London School of Hygiene and Tropical Medicine, and published by the British Medical Association (price 3*s*.). This useful handbook contains, among other matter, a list of the teaching centres and examining bodies, with the qualifications obtainable from them. The University of London alone gives a degree (M.D.) in Tropical Medicine, and this, being an "internal degree," can only be taken by students who are medical graduates of that university. Diplomas in Tropical Medicine or Hygiene are granted by the universities of Cambridge, Edinburgh, and Liverpool, and by the Conjoint Board of the Royal College of Physicians of London and the Royal College of Surgeons of England.

Diplomas and Degrees.

London University.—Tropical medicine is one of the six branches in which the M.D. degree may be obtained. The regulations relating to the curriculum and examination correspond to those applying to the other branches.

The Examining Board in England.—This body grants a diploma in tropical medicine and hygiene to candidates after an examination held in the months of February and July. Candidates must present evidence of having attended, subsequently to obtaining a registrable qualification in medicine, surgery, and midwifery, (1) practical instruction in pathology, protozoology, helminthology, entomology, bacteriology, and hygiene in relation to tropical medicine, in an institution recognized for this purpose during not less than five months, (2) the clinical practice of a hospital recognized for the study of tropical diseases during not less than five months. These conditions may be modified in the case of candidates who have had practical experience in tropical countries. The fee for admission to the examination is £9 9*s*. The Board also grants diplomas in public health, in psychological medicine, in ophthalmic medicine and surgery, in laryngology and otology, and in gynaecology and obstetrics. Candidates must hold a medical qualification registrable in the United Kingdom, or be graduates in medicine of a recognized Indian, Colonial or foreign university. Particulars and conditions of admission to these examinations, fees, etc., may be obtained from the Secretary of the Examining Board, Examination Hall, Queen Square, London, W.C.1.

University of Liverpool.—A diploma in tropical medicine is given by this university to students who have attended the courses provided by the Liverpool School of Tropical Medicine and have passed the examination held twice yearly by the university examiners. The subjects of

examination are (*a*) parasitology and tropical pathology; (*b*) entomology; (*c*) tropical medicine, including etiology, symptoms, diagnosis, and treatment of tropical diseases. Fee for the course, £21. A diploma in tropical hygiene (D.T.H.), open to the holders of the D.T.M., has recently been established. The subjects of examination are tropical hygiene (including sanitary engineering, vital statistics and epidemiology, and applied parasitology and entomology); practical sanitation, bacteriology, chemistry (including meteorology and climatology). Fee for the course, £12 16s. Further information can be obtained from the Dean of the Faculty of Medicine, University of Liverpool.

UNIVERSITY OF CAMBRIDGE.—This university grants a diploma in tropical medicine and hygiene to any person whose name has been on the *Medical Register* for not less than a year, provided that he passes the examinations of the university in this subject. Candidates for Part I are examined in the same subjects as candidates for Part I for the diploma in public health. Before admission to Part II, the subjects for which are medicine, surgery, and hygiene in their relation to tropical diseases, candidates must have passed Part I. An examination for Part I is held in April and for Part II in July. The fee for each part of the examination is 10 guineas. Application for further information should be made to Mr. J. E. Purvis, Public Health Chemical Laboratory, Medical School, Cambridge.

UNIVERSITY OF EDINBURGH.—Candidates for the diploma in tropical medicine and hygiene granted by the University of Edinburgh must be graduates in medicine and surgery of that university, or hold corresponding registrable degrees or qualifications of some other licensing body. The course of instruction extends over two terms, and may be taken either from October to March or from April to June and January to March. The examinations are written, oral, and practical, and are held at the end of the courses. Candidates are required on the first occasion of presenting themselves for examination to appear for all the subjects. Those who fail to pass the entire examination within a period of twelve months after first appearance are required to reappear for all the subjects. The university is included in the list of institutions whose courses of instruction in tropical medicine may be taken by officers on appointment to the Colonial Medical Services or during study leave. Full particulars can be obtained from the Dean of the Faculty of Medicine, Edinburgh.

SCHOOLS.

LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE (UNIVERSITY OF LONDON).

The courses of study in all branches of the work of the school will commence in the autumn in the new premises in Keppel Street (Gower Street), the gift of the Rockefeller Foundation, which has excellent laboratories and research rooms, a fine lecture theatre and class rooms, library, and museum,

In tropical medicine and hygiene there are two courses in the year, each lasting twenty-two weeks, inclusive of examinations. The dates for the commencement of the examinations are September 30th, 1930, and February 2nd, next courses are September 30th, 1930, and February 2nd, next course covers the work required for the 1931. The course covers the work required for the D.T.M. and H. (England) and part of that required for the M.D. in tropical medicine of the University of London.

The course of study for the diploma in public health will commence on September 29th, and will extend over a period of twelve calendar months. It is arranged in compliance with the requirements of the General Medical Council, and students taking the course will be able, should they so desire, to proceed to the new academic diploma in public health of London University. The curriculum has been planned on very practical lines, and includes, in addition to work with medical officers of health in two selected areas, a large number of visits to places of public health interest. A series of 5 o'clock lectures will be given by eminent authorities on special subjects, and these lectures will be open to members of the medical profession as well as to students of the school. The London County Council, the City of London, and various other bodies have placed their resources at the disposal of the school for teaching purposes.

The special course of study for the diploma in bacteriology covers a period of one academic year beginning in October, and special three-monthly courses commencing about September 29th will be given in epidemiology and vital statistics.

The Laleaca Medal (1913)—the gift of a committee appointed to perpetuate the memory of the late Dr. Cowas Laleaca—is awarded every two years to a student of the school for the best essay on clinical medicine and surgery in the Tropics. The competition is open to any student who has obtained the school certificate. The next award will be made in the autumn of 1931.

THE UNIVERSITY OF EDINBURGH.

A course of instruction for the diploma comprising a primary and a second course is given during the autumn and spring terms (October to March), and includes tropical hygiene, bacteriology, entomology, and parasitology, diseases of tropical climates (systematic and clinical), tuberculosis, and venereal diseases. The primary course alone is also given during the summer term, April to June. The university is included in the list of institutions whose courses of instruction in tropical medicine may be taken by officers on appointment to the Colonial Medical Services or during study leave. Full particulars can be obtained from the Dean of the Faculty of Medicine.

LIVERPOOL SCHOOL OF TROPICAL MEDICINE.

This school is affiliated with the University of Liverpool. The university now grants diplomas in tropical medicine (D.T.M.) and in tropical hygiene (D.T.H.).

Two full courses of instruction, each lasting about eleven weeks, are given every year for the D.T.M., commencing respectively September 30th (autumn term) and January 6th (Lent term); and two courses for the D.T.H., beginning on January 13th and April 23rd (summer term). The D.T.H. can only be taken by those who have obtained the D.T.M. Students who do not desire to take the diploma examinations held by the university at the end of each term are given a certificate if attendance has been satisfactory.

Fees.—(1) For the D.T.M. course, 20 guineas; for the D.T.H. course, 10 guineas. (2) For the diploma examinations, 5 guineas. An extra charge of one guinea is made for the use of a microscope if required.

The laboratories of the school adjoin the university and the tropical ward of the Royal Infirmary. The dimensions of the building are 162 feet in maximum length by 84 feet in width. In addition to the basement, in which are accommodated the photographic department and large storage rooms, there are four floors. The ground floor has: (1) lecture theatre, with accommodation for about seventy students; (2) library; (3) a spacious museum with preparation room adjoining. The first floor has twelve rooms, in which are housed the departments of tropical medicine and entomology. The second floor has the main class laboratory, 69 feet by 58 feet, excellently lighted; and three other rooms, devoted to the department of parasitology. The third floor has a large research laboratory and two research rooms. On the roof is an insectorium, a mosquito-proof house, and other accommodation.

Since its foundation the school has dispatched to the Tropics thirty-two scientific expeditions, many of the workers having been taken from among its students. The work done by the staff has been published in twenty-one special memoirs—in the *Annals of Tropical Medicine and Parasitology*, issued by the school, and in numerous articles in the scientific press.

The school has also two laboratories in the Tropics: the Manáos Research Laboratory in Brazil; and the Sir Alfred Lewis Jones Tropical Laboratory in Sierra Leone, which was opened on January 10th, 1922, and is staffed by the school. Further information may be obtained from the Honorary Dean, School of Tropical Medicine, Pembroke Place, Liverpool.

PSYCHOLOGICAL MEDICINE

It cannot be impressed too strongly upon the medical student that a knowledge of mental disorder is just as essential as a knowledge of the other forms of disease which he will be called upon to treat in the routine of general practice. It must be understood that by the term "mental disorder" is not only meant the severe forms which are to be found in mental hospitals, but the term also includes mental defective of all grades, nervous difficult and backward children, the mild and often unrecognized psychoses, and also the various types of psychoneurosis. Such disorders provide the general practitioner with a large proportion of his most difficult cases, and he will find a good knowledge of mental disorder invaluable in his work. Apart from general practice, the student who proposes to take up a career in the prison service or, still more importantly, the school medical service, will find a knowledge of psychological medicine an almost essential part of his equipment.

INSTRUCTION

Though at the present time the instruction given to the student is far from adequate to supply the knowledge of mental disorder requisite for the needs of the general practitioner, the facilities for the study of psychological medicine in the general hospitals are now much greater than in former years. Thus many of the teaching hospitals have out-patient departments for the treatment of mental cases, and in some of these hospitals special lectures are given in psychopathology. These facilities need not be utilized by the student, however, and the compulsory part of the curriculum is generally confined to formal lectures and a few attendances at some mental hospital. Here the student is apt to see mainly the advanced states of mental disease, and is likely to gain the impression that mental disorder is necessarily related to segregation and custody. We would therefore impress upon him the importance of attending the out-patient department for mental disorders, where he will be able to observe the mild and early cases such as he will hereafter meet with in general practice.

At the Middlesex Hospital a small number of mental cases are treated in the hospital as in-patients. This is an important move from the teaching point of view because the student will gain true insight into the relation between mental disorder and medicine as a whole, and he will realize that it is a form of illness to be studied with other diseases, and to be treated along similar lines.

In London post-graduate courses of instruction of a comprehensive kind are given at the Maudsley Hospital and at Bethlem Hospital, and at the National Hospital, Queen Square, courses are arranged to meet the requirements for the diploma in psychological medicine in regard to nervous diseases. Courses in mental deficiency are arranged by the University of London. There are also post-graduate courses at the various universities which grant diplomas of psychological medicine or of psychiatry.

DIPLOMAS

Those who are taking up psychiatry as a career will find it desirable to obtain a diploma in psychological medicine. Such a diploma is not at present compulsory for a permanent position on the staff of all mental hospitals, but it will probably become so in course of time, just as it is now essential to obtain the D.P.H. if a career in *public health* is contemplated. Psychiatry is one of the *branches of medicine* which candidates for the M.D. degree of the Universities of London and Edinburgh can take up, and in addition, diplomas in psychological medicine (D.P.M.) *to which reference has been made* can be obtained from the Universities of London, Edinburgh, Durham, Leeds, Manchester, Dublin, and the National University of Ireland, and from the Conjoint Board in England. The requirements for a diploma differ to some extent in the various universities and colleges.

University of London (D.P.M.)

The diploma awarded by the University of London certifies that the candidate has passed the examination in psychological medicine with special knowledge of one or other of the two branches, either psychiatry or mental deficiency, special provision being made for this in Part B of the examination. The examination is held twice in each year. Part A in March and October, and Part B in April and November. Part A consists of anatomy, histology, and physiology of the nervous system (one paper and a practical examination) and psychology (one paper and an oral examination). Part B consists of neurology (paper and clinical and oral examinations), and psychological medicine (two papers and clinical and oral examinations). Paper I tests the candidate's general knowledge of *both mental diseases and mental deficiency, and Paper II* is a special one consisting of two alternative sections, one relating to mental disease and the other to mental deficiency. A copy of the Regulations and of the Syllabus of Study will be sent on application to John Lea, M.A., University Extension Registrar, University of London, South Kensington, S.W.7.

Conjoint Board of England (D.P.M., P.C.P. and S.Eng.)

Both parts of the examination are held in June and December. The examination comprises the following subjects with special regard to their relationship to psychological and general medicine.—Part I. (*a*) anatomy and physiology of the nervous system, (*b*) psychology. Part II. (*a*) neurology (including clinical and pathological neurology), (*b*) psychological medicine including its legal relationships. The examination will be written and oral in Part I. and written, oral and clinical in Part II. No special certificates of study are required for Part I., but before entering for Part II. candidates must produce certificates of (*a*) having attended clinical instruction for at least two months at a recognized hospital for nervous disease or in the department for nervous diseases of a recognized general hospital, (*b*) having held a resident or whole-time appointment at an institution for mental diseases where clinical instruction is given recognized for the purpose, for a period of six months, or having attended clinical instruction in psychological medicine at a recognized institution during twelve months. Further particulars may be obtained from the Secretary, Examination Hall, 8 11 Queen Square, London, W.C.1.

University of Edinburgh (Dipl. Psych.)

Candidates for the diploma must have held subsequent to graduation (*a*) a resident appointment for one year in a hospital for mental disorders approved by the Faculty, or (*b*) a six months' appointment as above and six months' practical study of nervous diseases in a special or general hospital approved by the Faculty. The examination comprises.—Part I. (1) anatomy of the nervous system, (2) physiology of the nervous system, (3) psychology and experimental psychology. Part II. (1) neuropathology, (2) clinical psychiatry, (3) clinical neurology, (4) an additional subject selected by the candidate from a prescribed list. Further particulars may be obtained from the Dean of the Faculty of Medicine, the University of Edinburgh.

University of Leeds (D.P.M.)

The examination is in three parts, and is written, oral and practical. Subjects of examination.—Part I. (1) the development, anatomy and histology (human and comparative) of the nervous system, (2) the physiology of the nervous system and of the organs of special sense, (3) general psychology. Part II. (4) the pathology of the nervous system. Part III. (5) clinical psychiatry, (6) experimental and *morbid psychology*, (7) (*a*) clinical neurology, (*b*) mental hospital administration, (*c*) medico-legal aspects of insanity. Candidates in order to pass must satisfy the examiners in the practical and clinical parts of the examination in Parts II. and III., respectively. They may present themselves for the three parts of the examination separately or at the same time, provided that no candidate shall be allowed to pass in Part II. unless he has already passed in Part I. or in Part III. unless he has already passed in Parts I. and II. Evidence must be produced by candidates as to attendance of approved courses of instruction before they submit themselves to Part I. of the examination. Particulars may be obtained from the Academic Sub-Dean, School of Medicine, Leeds.

University of Manchester (D.P.M.)

The examination is in two parts. Before presenting themselves for either part of the examination candidates must produce evidence of having attended subsequent to qualification certain approved courses of instruction, particulars of which may be found in the prospectus of post-graduate courses.

The course of study extends over a period of three university terms, two of which must be taken in the university, the remaining term may be taken at the university, or at some approved institution The subjects of examination are — Part I (1) a written and practical examination on the development, anatomy (human and comparative), and physiology of the nervous system, (2) a written and practical examination in psychology (theoretical and experimental) Part II (1) a written and practical examination in pathology in relation to the nervous system, (2) a written, clinical, and oral examination in psychological medicine, (3) a clinical and oral examination in clinical neurology For further information application should be made to the Dean of the Medical School the University Manchester

University of Durham (D Psy)

The examination for the Diploma in Psychiatry consists of two parts Part I anatomy, physiology, pathology and bacteriology, Part II psychology and experimental psychology, neurology and psychiatry (systematic and clinical), and candidates may present themselves for the whole examination or for either part separately Particulars of the courses of instruction may be had on application to the Dean, College of Medicine, University of Durham Newcastle on Tyne

University of Dublin Diploma

A post graduate diploma in psychological medicine is conferred upon registered medical practitioners who have held a resident medical appointment at a recognized institution for the treatment of mental diseases for twelve months, or who have held such an appointment for six months and have attended clinical instruction at an approved institution for six months Particulars of special courses of instruction may be obtained from the Registrar of the School of Physic, Trinity College, Dublin

National University of Ireland Diploma

The National University of Ireland grants a diploma in mental diseases Application should be made to the Registrars of the Constituent Colleges, University College, Dublin University College, Cork, and University College, Galway, for all information

COURSES OF INSTRUCTION

Maudsley Hospital, London

A course of instruction for the Diploma in Psychological Medicine is given annually at the Maudsley Hospital Denmark Hill, from January to May inclusive, the details of the last course being as follows The course consisted of two parts In the first part lectures on the anatomy of the nervous system were given by Professor Le Gros Clark with practical instruction by Mr C Geary A course of lectures on the physiology of the nervous system, with demonstrations in physiological psychology, was given by Dr F Golla, a series of lectures and demonstrations on the biochemical aspects of mental disorders, and laboratory methods, by Mr S A Mann, and on theoretical and practical psychology by Dr Henry Devine For the second part of the course lectures on morbid psychology and psychiatry were given by Dr Mapother, on the neuroses by Dr Bernard Hart on therapeutics by Dr Petrie, on general pathology by Dr Golla and Mr C Geary, and on pathological chemistry by Mr Mann Dr Shrubsall lectured on mental deficiency, and Dr East on criminal insanity Dr Golla and Dr Walshe gave instruction on clinical neurology, and Mr Foster Moore on eye changes as applied to psychiatry The fee for the whole course (Part I and Part II) was 15 guineas, or for either part separately 10 guineas, for one single series of lectures in Part I the fee was 4 guineas, and in Part II 2 guineas Inquiries as to lectures etc should be addressed to the Director of the Central Pathological Laboratory, Maudsley Hospital, Denmark Hill S E 5

Bethlem Royal Hospital

The new Bethlem Hospital has recently been opened at Monks Orchard, Eden Park, Beckenham, Kent, where every facility will be available for the clinical study of nervous and mental disorder The classification of patients will be a prominent feature in the administration of the hospital and treatment in all its modern and specialized aspects can be carried out at the Lord Wakefield of Hythe Treatment and Research Laboratories It is proposed to give two courses of lectures and practical instruction for the Diploma in Psychological Medicine each year, in spring and autumn It is contemplated that the first course will commence in January, 1931 These are of intensive character, commencing in September and completed in early December, and a spring session commencing in the middle of January and completed in the middle of April Each course consists of two parts Part A includes lectures and demonstrations on the anatomy, histology, and physiology of the nervous system, with lectures on psychology and demonstrations in experimental psychology Part B comprises lectures and clinical demonstrations in psychology, including lectures and demonstrations in the morbid anatomy of the nervous system a series of lectures, with clinical demonstrations, on different branches of psychological medicine, and lectures, with clinical demonstrations, on mental deficiency Entrants for the course who pay a composition fee of 15 guineas may, if due notice is given, attend either Part A or Part B of one course and postpone the other part until the next session An entrant who wishes to attend one part only pays a fee of 10 guineas An entrant who takes the complete course can attend the general clinical practice of the hospital on payment of 5 guineas for six months, or 10 guineas for one year, but an entrant who does not take either part of the course and desires to attend the clinical practice of the hospital must pay a fee of 5 guineas for each three months of attendance To enable post graduates to obtain special experience in this branch of medicine clinical assistants are appointed from time to time Further particulars may be obtained from the Physician Superintendent Monks Orchard, Eden Park, Beckenham, Kent

National Hospital Queen Square

Post graduate courses which fulfil the requirements of the regulations for the Diploma in Psychological Medicine in regard to instruction in nervous diseases are held at the National Hospital, Queen Square, Bloomsbury, W C 1, thrice annually, usually during February to March May to June, and October to November Lectures on the anatomy, physiology and pathology of the nervous system and various clinical lectures are delivered and demonstrations are given Out patient clinics are held at the hospital on the afternoons of Mondays, Tuesdays Wednesdays Thursdays and Fridays In inclusive fee of 10 guineas is charged for the whole course, but any part of the course can be taken separately at a special fee A special arrangement is made for those unable to attend the whole course, and for details applications should be made to the Dean of the Medical School Fees are payable to the secretary of the hospital on entering for the course

Tavistock Square Clinic for Functional Nervous Disorders

Courses in the theory and practice of modern psychotherapy are held at this clinic every term The subjects dealt with include the various schools of analytical psychology, treatment by persuasion and suggestion, differential diagnosis, and physical factors Syllabus and particulars of dates and fees may be obtained from the Honorary Lecture Secretary at 51, Tavistock Square, London W C 1 Clinical assistantships are from time to time available for graduates who have attended such courses The director of the clinic is Dr H Crichton Miller the deputy director Dr J R Rees, and there is a large children's department The 'short course" lasts for a fortnight and consists of twenty lectures, ten case discussions, and two demonstrations It is intended for senior students and those engaged in post graduate study The "long course" lasts for twelve weeks, and consists of two lectures on Wednesday afternoons It is intended for senior students, and particularly for general practitioners in the London area

Particulars of the courses of instruction arranged by the other universities granting the diploma may be obtained on application to the addresses given above (see Diplomas)

MENTAL HOSPITAL APPOINTMENTS

Those who take up psychiatry as a career work as medical officers of public or private mental hospitals or similar institutions Except in the larger institutions, such as those under the control of the London County Council, where a number of the medical officers are allowed to live out if married, the medical staff are resident officers, having board, lodging, etc, either in the hospital itself or a residence in the grounds Junior assistant medical officers receive about £300 to £400 per annum, and senior assistant medical officers about £500 to £700, in both cases with board, lodging, laundry, etc, in addition, if married, the board, etc, is commuted for cash As the mental hospitals are under local control the salaries vary much in different asylums Medical superintendents, who are par

commonly ranges between £800 and £1,500 per annum are provided with a house in the grounds of the hospital, and draw various allowances.

Since the passing of the Asylum Officer Superannuation Act of 1909, all officers and others of the establishment of a public (county or borough asylum) mental hospital may retire at the age of 55 on a pension varying from one-half to two-thirds of the value of their pay and emoluments, or one fiftieth for every year served, paying as contribution 3 per cent. of the value of the appointment annually. The very favourable pro pects may not appeal to junior practitioners joining the service, but will eventually prove to be a valuable asset.

Prospects in the Public Service

Appointments to the public mental hospital are made by the visiting committees and in most cases only the junior posts are open to those who have not had previous experience in psychiatry. Since the public mental hospital service is a local and except indirectly not an imperial one, the promotion tend to be low and uncertain, and the higher positions are not always advertised and thus thrown open to competition. For this and other reasons mental hospital work has undoubtedly not been in favour with newly qualified men in recent years, but the general condition of service continue to show a progressive improvement.

Both the British Medical Association and the Royal Medico-Psychological Association are working separately and together to improve present conditions of service and have, for example, already removed the celibacy objection to the service. The salaries have also been considerably increased especially in the junior ranks. During the last few years considerable progress has been made in the conditions under which the insane are treated. The mental hospitals are developing an atmosphere approximating more closely to that of the general hospitals. As a result of these developments the mental hospital service is becoming more attractive, and now affords greater opportunities for the medical graduate who proposes to specialize in psychiatry.

While routine administrative and clerical work built largely in mental hospital duties as they do in other public medical services there is ample material time and scope for purely medical work and research—difficult as the subject may be—in psychiatry a one of the branches of medicine open to young graduates. Most mental hospitals are now equipped with efficient clinical laboratories, moreover, those who wish to undertake research are afforded every opportunity of doing so in the pathological department of the Maudsley Hospital and also in various other centres in England and Scotland.

THE PUBLIC HEALTH MEDICAL SERVICES

The central authority to secure the adoption and effective administration of measure conducive to the health of the people, and to promote research work and the proper training of persons for health services is the Ministry of Health.

For the purpose of local public health administration the whole of England and Wales is divided into counties county boroughs boroughs and urban and rural sanitary districts. The administrative County of London exclusive of the City of London, is divided into twenty-eight metropolitan boroughs.

The public health medical services for Great Britain embrace between three and four thousand medical men and women who give whole-time services and in addition, a large number who give part-time services. The medical officers appointed for these services may be either medical officers of the Ministry of Health for England and of the corresponding Boards of Health for Scotland and Wales or —and these form the large majority—they may be medical officer appointed by the many local public health authorities. The latter appointments include medical officers of health tuberculosis medical officers maternity and child welfare medical officers venereal diseases medical officers and school medical officers—who must be regarded as working in the health interest of the school child. By the larger public health authorities assistant medical officer are also appointed and these posts often serve as stepping stones to the higher offices as vacancies which are required to be advertised occur.

Medical Service of the Central Authority

For England the medical work of the Ministry of Health has been organized under the control of a Chief Medical Officer. It is subdivided into eight sections with a senior medical officer at the head of each and about a hundred medical officers or whole-time equivalent medical officer employed for certain duties under the Health Insurance Act. Briefly the section deal with environmental hygiene epidemiology, and international health matters and child welfare tuberculosis and venereal diseases the supervision of the food supplies sanitary administration in relation to infectious diseases national health insurance, and the school medical service. Vacancies in the staff are advertised from time to time in the medical journals and appointments are made by the Minister on the recommendation of a Selection Committee. These are Civil Service appointments subject to the usual conditions as to pension holidays etc. Medical officers are also employed by the Welsh Board of Health (Cardiff) and the Department of Health for Scotland (Edinburgh).

Medical Officer of Health

The duties of a medical officer of health are to inform himself upon all influences affecting or threatening to affect injuriously the public health within his district to advise the sanitary authority upon all matters relating to health and to perform all the duties imposed upon him by statute by law and regulations. He must prepare and submit to his local authority special and annual reports give immediate information to the Ministry of Health of any serious outbreak of disease and subject to the instruction of the sanitary authority he shall direct or superintend the work of sanitary inspection.

By the Sanitary Officers Order 1926 no person is qualified to be hereafter appointed or reappointed as a medical officer of health of any district or combination of districts unless in addition to the qualifications prescribed by any statute he is also either registered in the Medical Register as the holder of a Diploma in Public Health Sanitary Science or State Medicine or has had not less than three years previous experience of the duties of a medical officer of health.

The Public Health (Officers) Act 1921, which was promoted by the British Medical Association, provides that a whole time medical officer of health of a county borough or urban and rural district in England and Wales a part of whose salary is contributed by the Exchequer shall not be appointed for a limited period and shall not be removed from his office except by or with the consent of the Minister of Health. A similar security of tenure also applies to all medical officers of health of county councils areas of London boroughs.

Under the Sanitary Officers Order 1926 a medical officer of health who does not devote his whole time to the duties of his office but a portion of whose salary is obtained from Exchequer grant may be appointed without limit of time in which case he cannot be removed from office without the consent of the Minister. If he is appointed for a specified term say one year he continues to hold office from year to year unless the Minister consents to his removal. Where the electing body pays the whole of the salary of such a medical officer of health he may be dismissed from office without reference to the Ministry of Health.

A considerable number of authorities have now adopted the Local Government and Other Officers Superannuation Act, 1922. Under this Act if an officer is incapacitated by

ill health after ten years of service, or if he has reached 65 years of age, he is entitled to superannuation on the following scale after ten years' service, 10/60 of the average salary which he received during the last five years of employment, after eleven years, 11/60, and so on up to a maximum of 40/60 after forty years or more of service. This Act, however, remains permissive, and it fails to make due allowance, in computing service for purposes of superannuation, for the more advanced age, as compared with other officials, at which the medical officer of health can enter the public service. In these two respects the position reached falls short of that for which the British Medical Association has been working for some years.

In Scotland the position is different in some respects. The central authority is the Board of Health, with a staff of medical officers for health insurance work. Under the Public Health (Scotland) Act, 1897 no one can be appointed as medical officer of health for any area unless he possesses the Diploma in Public Health. No medical officer can be removed from office except with the sanction of the Board of Health. A "proper" salary must be paid, and the local authority may not bring about the resignation of the officer by indirect means, such as reducing the salary or attaching new conditions to the appointment. The Act says nothing about superannuation or the age of retirement.

School Medical Officers

School medical officers are appointed by local education authorities. Primarily their duty is to detect among the children attending the public elementary schools any physical or mental defect which may retard education, and to inform their parents of its existence. Most approved schemes of medical inspection include arrangements which facilitate the task of parents in obtaining for their children the necessary treatment, check the results of this treatment, and keep each defective child under skilled observation both at home and at school until it has passed altogether out of the education authorities' hands. Indeed, it is now the practice for the education authorities themselves to provide for certain ameliorative work, notably the prescription of glasses where necessary, dental treatment, the removal of adenoids and tonsils, and treatment in connexion with certain diseases of the skin and some physical and mental defects. The general effect of all schemes alike is to make the inspection imposed by law of benefit, not merely to the individual child, but to the community at large, by preventing the development of conditions which lead to the existence of a large proportion of inefficient citizens among the adult population. The work is so related to that of medical officers of health that, generally, the senior school medical officer fills both appointments, his work, when necessary, being supplemented by that of whole- or part-time assistants. A diploma in public health is almost always required of those entering the school medical service.

In Scotland, while the statutory authority for the work of the school medical service is different, the scheme of work is broadly the same.

Tuberculosis Medical Officers

A tuberculosis medical officer is a whole-time officer with special training and experience in tuberculosis work and of a suitable age and attainments to command general confidence. In England such officers are appointed by county councils and county borough councils, and their duties are to carry out the work of diagnosis of tuberculosis, to advise as to treatment and to take charge of the work of tuberculosis dispensaries and sanatoriums where these are in operation. The work under tuberculosis schemes is co-ordinated with the general public health work of local authorities, and so the medical officer of health is often appointed as the chief tuberculosis officer, or when a special tuberculosis officer is on the staff of the local authority. The arrangements in Scotland are very similar. In Wales tuberculosis work is carried out under the aegis of the Welsh National Memorial Association, upon which the constituent local authorities are represented, and the appointments of tuberculosis officers are vested in the Association.

Maternity and Child Welfare Medical Officers

Any public health local authority, however small, may make arrangements for maternity and child welfare work within its area, although very generally the smaller local authorities are provided for in county council schemes. For the schemes of the smaller local authorities the services of a part-time medical officer are obtained when the medical officer of health does not himself undertake the duties, but for the larger schemes special whole-time appointments are made. The maternity and child welfare medical officer is responsible for the work at the centres provided and for directing the home visitations, and these activities are closely co-ordinated with the other branches of public health work directed by the medical officer of health.

Much of this work was commenced in different parts of the country by voluntary organizations, some of it still remains in their hands, and is only loosely linked up with the public health local authority, but the tendency is for the whole of it to be undertaken by the local authorities. A large number of women medical officers have been appointed to these posts.

Venereal Diseases Officers

Schemes for the diagnosis and treatment of venereal diseases are provided and administered by county councils and county borough councils. In some cases the officer is on the whole-time public health staff, and in others he is a part-time official. Special knowledge and practical experience in the treatment of venereal diseases are essential. The officer appointed for either whole-time or part-time service works at one or more clinics, and also gives instructions and assistance in the treatment of venereal diseases to general practitioners, who are allowed to attend the clinics.

Remuneration in the Public Health Service

In order to ensure that public health authorities may obtain skilled and highly trained medical officers it is essential that such officers should receive salaries commensurate with their attainments, bearing a reasonable relationship to the time and money expended in fitting them for their important and responsible duties, and comparing well with the income which might be secured in other lines of medical work. With this end in view the British Medical Association and the Society of Medical Officers of Health prepared a scale of minimum commencing salaries for whole-time public health medical officers.

The scale, which was put into operation in 1925, was attended with a large measure of success. There were, however, certain aspects of it which were not entirely satisfactory. For instance, it was not retrospective and did not, therefore, apply to medical officers who had been appointed prior to the date on which it came into force, and it contained no provision for specified increments in salary.

As the result of a series of conferences between representatives of the various Associations of Local Authorities and the British Medical Association and Society of Medical Officers of Health, under the chairmanship of Lord Askwith, a Memorandum of Recommendations in regard to salaries of public health medical officers has been drawn up and came into force in June of this year. This Memorandum was published in the *Supplement* to the *British Medical Journal* of July 27th, 1929 (p. 71). It has been adopted by the Representative Body and has been accepted by the representatives of the following bodies representing local authorities:

- The Association of Municipal Corporations
- The Urban District Councils Association
- The Rural District Councils Association
- The London County Council
- The Association of Education Committees
- The Mental Hospitals Association
- The Metropolitan Boroughs Standing Joint Committee

Unfortunately, it has not been accepted by the county councils as a whole. A small number of them have accepted it, but the majority, for various reasons do not see their way to adopt it. The advertisements of local authorities

who are not prepared to put into effect the whole of the recommendations will not be published by the *British Medical Journal* which in this matter will have the co-operation of the *Lancet* and the *Medical Officer*.

The great advantage of the Memorandum is that it embodies a general agreement as to salaries and conditions of service, and is not merely a scale of salaries. It is retrospective and will therefore benefit officers appointed before it came into force. It provides stated increments for practically all medical officers except those in the chief medical officer of health who as the chief medical official may it is presumed depend that the commencing salaries mentioned in the Memorandum will be increased for meritorious work and year of service and it contains a very valuable provision by which questions of difficulty can be referred to an advisory committee.

For the right class of practitioner with leanings in the direction of public health work the service offers an attractive career, but it must always be remembered that there are comparatively few posts which carry high salaries.

The Regulations for the Diploma in Public Health

The Examination

By the most recent Regulations or Rules of the General Medical Council which came into force on January 1st 1924, the examination for the D.P.H. is divided into two parts and no candidate is allowed to sit for the final part of the examination until two years have elapsed since a registrable qualification was obtained. The object of this two years interval is to provide opportunity for candidates for the Diploma or Degree in Sanitary Science Public Health or State Medicine to pass from the state of pupilage to that of responsible practitioners to give mature consideration to the obligations and duties involved in the work of the Public Health Service and to acquire direct experience of medical work in a responsible capacity either in practice or in hospital or laboratory appointments.

The examination is both written and oral and must include a practical examination in bacteriology and chemistry (Part I) and in infectious diseases food inspection inspection of premises dwellings factories work shops schools etc. (Part II).

Any candidate who possesses a qualification entitling him to registration on the British Dominion or Foreign List or the *Medical Register* can be admitted to examination provided he has complied with the regulations of a licensing body in the United Kingdom based on the rules of the General Medical Council and that before being admitted to Part II of the examination his qualification has been registered in the United Kingdom. Only diplomas in public health granted by bodies in the United Kingdom are registrable in the *Medical Register*.

The Curriculum for the Diploma in Public Health

The curriculum must extend over a period of twelve months, and a candidate is admitted to either part of the examination after he has completed the prescribed courses of instruction in the subjects thereof. At least five months must be given to practical laboratory instruction in an institution approved by the licensing body in the subjects

(1) Bacteriology and parasitology including entomology especially in relation to diseases of man and to those diseases transmissible to man from the lower animals (120 hours of such instruction is required)

(2) Chemistry and physics in relation to public health (90 hours of such instruction is required)

(3) Meteorology and climatology (10 hours of such instruction is required)

Therefore at least 220 hours of practical instruction extending over a period of at least five months is demanded before a candidate is eligible for Part I of the examination.

For a candidate to become eligible for Part II of the examination he must first receive instruction in

(1) Principles of public health and sanitation (for approximately 30 hours)

(2) Epidemiology and vital statistics (approximately 20 hours)

(3) Sanitary law and administration including public medical services (approximately 20 hours)

(4) Sanitary construction and planning (approximately 10 hours)

(5) Every candidate must also have made thirty attendances of not less than two hours in each week of a three months' period at the clinical practice of a recognized hospital for infectious diseases and he must have received instruction in methods of administration.

(6) Every candidate must produce evidence that he has during a period of not less than six months been engaged in acquiring a practical knowledge of the duties routine and special of a medical officer of health administration under the supervision of a medical officer of health who shall certify that the candidate has received from this officer or other competent medical officer during not less than three hours on each of sixty working days practical instruction in these duties and those relating to

(a) Maternity and child welfare service
(b) Health service for children of school age
(c) Venereal disease service
(d) Tuberculosis service
(e) Industrial hygiene
(f) Inspection and control of food including meat and milk.

Certificates of having received the prescribed instruction in public health administration must be given by a medical officer of health who devotes his whole time to public health work or by the medical officer of health of a sanitary area having a population of not less than 50,000 or in Ireland by the medical superintendent officer of health of a county or county borough having a population of not less than 50,000.

Training and Examining Centres for Public Health Qualifications

Degrees in Sanitary Science are conferred in England by the Universities of London, Durham Liverpool, and Birmingham, in Scotland, by the Universities of Glasgow and Edinburgh and in Ireland by the Universities of Dublin and Cork. In most cases these degrees are conferred only upon medical graduates of the universities granting them.

Whereas for the Diploma of Public Health the requirements of the General Medical Council are strictly confined to these requirements are extended as a rule a demanded before Degrees in Sanitary Science are granted. Almost all the universities of Great Britain and Ireland grant a D.P.H. and provide for the necessary training. The English and Scottish Conjoint Boards and the Irish Colleges also grant these diplomas.

The post-graduate teaching and training in public health in London is provided mainly at one centre—the London School of Hygiene and Tropical Medicine (University of London) the only other training centre which offers such facilities being the Royal Institute of Public Health.

The course of study for the D.P.H. a provided by the London School of Hygiene and Tropical Medicine is for a period of twelve calendar months and students who have obtained diplomas in tropical medicine proceed to the new academic diploma in public health. The University of London School of Hygiene and Tropical Medicine offers extensive facilities for research work in connection with public health problems placed at their disposal and are privileged to attend room staff and special lectures.

The Royal Naval Medical College and the Royal Army Medical College provide courses of training to the medical officers of the two services.

Degrees and Diplomas in Public Health are registrable qualifications but not so those in Tropical Medicine and Hygiene.

Qualifications in Tropical Medicine and Hygiene

The University of London grants a degree (M.D. in Tropical Medicine) to its medical graduate and the course of training required must extend over at least one academic year.

Diplomas in Tropical Medicine and Hygiene are granted in England by the Universities of Cambridge and Liverpool and by the English Conjoint Board and in Scotland by the University of Edinburgh. Among the institutions which provide qualifying courses are the London School of Hygiene and Tropical Medicine the Liverpool School of Tropical Medicine and the Royal Army Medical College restricted to army medical officers. The training provided is In the last-mentioned institution the training period for these diplomas is about six months. Graduates of medicine and surgery of recognized universities whose degrees are not registrable in this country may enter for the examination of the English Conjoint Board, and the

conditions of study may be modified on the grounds of previous work in the Tropics or of original investigations undertaken

The Colonial Office has decreed recently that the holder of a D T M and H, or of a D T H, is eligible for appointment as a medical officer of health in places and districts other than those with large populations In the latter cases a D P H is required

Those wishing for the details of syllabus of study, fees, date of commencement of the training courses, and the dates of examinations, etc, of any particular training course or examining body, will find these fully and clearly set out with notes and comments, in the *Guide to the Regulations, Courses and Examinations for Qualifications in Public Health and Tropical Medicine and Hygiene in Great Britain and Ireland*, which has been prepared by Sir Andrew Balfour, K C M G, and published by the British Medical Association (Tavistock Square, W C 1) The price is 3s net

The University of Manchester has a well-equipped department of bacteriology and preventive medicine, where candidates preparing for the examinations of the various university and examining boards for the Diploma in Public Health can obtain instruction It also prepares candidates for the Diploma in Bacteriology and in Veterinary State Medicine, granted by the university, and for its Certificates in Factory Hygiene and School Hygiene Full particulars can be obtained from the Dean of the Medical School, the University, Manchester

The University of Edinburgh grants a Diploma in Public Health The course, which extends over a period of twelve calendar months, can be commenced in October only, and provision is made by the university for instruction in all the subjects Candidates for the diploma must be graduates in medicine and surgery of the University of Edinburgh, or must hold corresponding degrees or registrable medical qualifications, which must be registered before a candidate is admitted to examination The course for the diploma is divided into two parts, for each of which examinations are held twice annually—in March and July for Part I, and in October and March for Part II In each part the candidate must pass in all the specified subjects at one examination Admission to the examinations is contingent upon the candidate having complied with the following conditions

PART I.—(*a*) Completion, subsequent to obtaining a registrable medical qualification, of the course of instruction prescribed for Part I

PART II.—(*b*) Completion, subsequent to obtaining a registrable medical qualification, of the course of instruction prescribed for Part II (*c*) A lapse of two years after obtaining a registrable medical qualification (*d*) Previous passage of examination in all subjects of Part I

Further particulars can be obtained from the Dean of the Faculty of Medicine, Edinburgh

THE SERVICES

ROYAL NAVAL MEDICAL SERVICE

A CAREER as a medical officer in the Royal Navy offers very definite attractions In the large naval hospitals the medical, surgical, and specialist work is of a very high standard The work is exacting, and it is the aim of the Admiralty to arrange appointments as far as possible so that medical officers have an opportunity of alternating their work not only at home and abroad, but also ashore and afloat

To give naval surgeons opportunities for professional work has always been a very definite policy of the Admiralty, and within the last year or so this matter has received still further attention The general and specialist courses have been increased so that, as far as possible, every officer shall have a course of instruction of not less than four months' duration every four years The number of specialists allowed is now sixty, and the specialist allowance is 5s a day The establishment of Surgeon Captains has been increased to twenty and every recent improvement has been made towards giving increased opportunities of advancement and accelerated promotion to the best men

Examinations for direct entry into the Medical Service are at present in abeyance Entries are made by means of the short-service scheme

General Conditions of the Short service Scheme

A candidate must be registered, must be under 30 years of age, and must be recommended by the dean of his school, if, however, the candidate intends to apply for transfer to the permanent list, he must have been under 28 years of age at the time of his entry He must be a British subject of pure European descent Unmarried candidates will be preferred A candidate will be interviewed by the Medical Director General R N and will undergo a physical examination If considered eligible by the Medical Director General his name will be submitted to the Board of Admiralty, and he may be appointed "surgeon lieutenant for short service" A candidate must engage for three years, with the option of continuing for a further period of twelve months if his services are still required The present rate of pay is £1 4s 8d a day or £450 3s 4d a year, with the same allowances as are payable to permanent officers of their rank Lodging money at the rate of £80 a year is usually allowed when employed on shore, without quarters in the United Kingdom, and £56 10s a year in lieu of rations when not victualled in kind On joining an allowance of £50 for uniform is made

An officer engaged for three years is entitled to receive two months' notice of his services being no longer required A gratuity of £8 6s 8d will be payable to officers for each completed month of service on completion of their period of service, or to any who are invalided for causes not within their own control before the completion of the prescribed period

Transfer to Permanent Service

A short service surgeon lieutenant, after six months service, may be considered, on application to the Secretary of the Admiralty, for transfer to the permanent service, and would be permitted to count his seniority from the date of entry for short service for purposes of promotion, increment of full pay, and for retired pay, but for purposes of retiring gratuity on the permanent officers' scale his service will reckon only from the date of transfer to the permanent list

Antedates of Seniority on Account of Civil Hospital Appointments held before Entry

Officers who have held appointments as medical or surgical officers in civil hospitals for any period prior to entry, after becoming qualified medical practitioners, are eligible to have their seniorities antedated by not more than one year The eligibility of appointments in civil hospitals to count for time will be decided by the Medical Director General of the Navy

The increase of seniority will count for the purpose of increase of full and retired pay, etc, as from date of transfer to the permanent list in the case of surgeon lieutenants for short service Short-service surgeon lieutenants claiming antedates of seniority must apply for transfer within eighteen months of entry

Promotion

Promotion to surgeon commander is attained on completion of twelve years' service, and officers of that rank are selected for promotion to the twenty seven higher ranks (surgeon captain, surgeon rear admiral, and Medical Director General) as vacancies occur

Officers obtaining more than 75 per cent of marks at the examinations held at the termination of Parts I and II of the course for promotion to surgeon commander are eligible for advances of seniority as follows

Over 75 per cent marks	12 months
„ 85 „ „ „	18 months

Special promotions (limited in number) may be made to the ranks of surgeon commander and surgeon lieutenant commander in cases of distinguished service or conspicuous professional merit

Medals and Prizes

The Gilbert Blane Medal, awarded annually to the surgeon lieutenant commander who obtains the highest aggregate marks at the examination for promotion to the rank of surgeon commander, and the Chadwick Naval Prize, the North Persian Forces Memorial Medal, and the Parkes Memorial Prize are open to naval medical officers

Post Graduate Instruction in the Naval Medical Service

Course on Entry.—A course of two months duration at the Royal Naval Hospital, Haslar, is given to each short service officer on entry

General Professional Courses.—These courses at the Royal Naval Hospital, Haslar, of four months' duration, are normally arranged for officers lower than surgeon captain's rank, once in every four years The subjects of these courses of instruction are clinical medicine and surgery and allied subjects, and on the completion of the courses officers are appointed to a large naval hospital unless and until they receive appointments elsewhere

Course for Promotion to Surgeon Commander.—This course of five months duration, is normally taken by officers of six to eight years' service Three months of the course are spent at the London Hospital, and two months at the Naval Medical School, Royal Naval College, Greenwich

Specialist Courses.—These courses, of three to six months duration are arranged at recognized civil teaching centres for officers selected for specialist posts, and officers will subsequently undergo

courses of three months' duration in their special subjects every four years while employed as specialists.

Refresher Courses (Old Scheme).—The existing three months' post-graduate courses at civil hospitals will to a large extent be superseded by the general professional and specialist courses described above, but it is not intended to discontinue until the new courses have been in operation for some years.

Medical officers R.N. are given the opportunity to prepare for and take higher specialist qualifications—for example, M.D., M.R.C.P., F.R.C.S., D.P.H., D.T.M. etc.

Rates of Pay

The current rates of full pay and retired pay are set out below. The 1 per cent. addition which was made in 1920 when the cost of living was high, 20 per cent. of the standard rate is regarded as variable, a deduction of 7 per cent. from the standard rate which were fixed in 1922 when the cost of living was low. The 1 per cent. addition will be varied from time to time in accordance with the cost of living figures or fall.

Full Pay

	Per Annum
	£
Surgeon Lieutenant (Short service and Permanent Entry)	365
Surgeon Lieutenant Commander (from 1 after 6 years' service)	450 to 543
Surgeon Commander (from 1 after 6 years' service)	533 to 657
Surgeon Captain (promotion by selection)	657
Surgeon Rear Admiral (promotion by selection)	1,101 to 1,825
Medical Director General (Surgeon Vice Admiral)	2,555

There are also allowances which form a substantial addition to the rates of pay. There are specialist appointments open to medical officers. They comprise specialist posts in medicine, surgery, diseases of the eye, ear, nose and throat, radiology, hygiene, etc., and an allowance at the rate of 5s. a day is payable to holders of them.

Medical officer in charge of naval hospitals and sick quarters receive charge pay on the following scale:

Surgeon Rear Admirals and Surgeon Captains	10s. a day
Surgeon Commanders	£1 a day

Maximum Retired Pay
(Approximate current rates.)

	£	Age for compulsory retirement
Surgeon Vice Admiral	1,112	On vacating office
Surgeon Rear Admiral	890	60
Surgeon Captain	834	55
Surgeon Commander	556	50
Surgeon Lieutenant Commander and Surgeon Lieutenant	419	45

Thus an officer who is not promoted above the rank of Surgeon Commander would be compulsorily retired at the age of 50.

Gratuities on Retirement

The following gratuities are payable if an officer of the permanent list is permitted to retire voluntarily:

After years full pay service	£
8	500
12	1,000
16	1,500
	250

Further Particulars

Full particulars and a form of declaration can be obtained from the Medical Director-General, Admiralty, Queen Anne's Chambers, Tothill Street, London, S.W.1.

ARMY MEDICAL SERVICES

ENTRANCE to the Royal Army Medical Corps, either by competitive examination or by selection as decided by the Army Council, will take place half-yearly in January and July. The examinations in medicine and surgery are entirely of a clinical and practical character, partly written and partly oral.

In addition to the grant of permanent commissions the War Office offers a number of temporary commissions in the Royal Army Medical Corps, the holders of which may be invited at the end of twelve months' service (if suitable and provided that vacancies exist) to accept permanent commissions in the Royal Army Medical Corps. If a permanent commission is accepted the temporary service is allowed to count as the equivalent of permanent service for promotion, increase of pay and retired pay. These conditions enable the young medical man to make a quaintance with army life without detriment to his tunate prospects, before deciding whether to make a permanent career in the Royal Army Medical Corps.

The regulations for admission, giving full details, can be obtained from the Under Secretary of State (A.M.D.1), War Office, Whitehall, London, S.W.1, and should be carefully studied. A personal interview with a representative of the Director-General, Army Medical Services, is readily obtainable.

The rates of pay and allowances are good, the opportunities of post-graduate study are generous, and the work is varied, responsible and interesting. The gratuities after certain periods of service enable officers who should he so desire to leave the service with a capital sum large enough to go a long way towards establishing him in civil life and further the knowledge of the world and the comradeship of his fellow officers that he has gained in the Army will be of no small value to him.

New entrants, who must be 22 and not over 28 years of age, are commissioned in the rank of lieutenant; the first six months of service are spent on probation during which time in addition to their military training at the Royal Army Medical Corps Depot at Aldershot they undergo a probationary course at the Royal Army Medical College in London in hygiene, pathology, tropical medicine, military surgery, recruiting, the prevention and treatment of venereal disease and the elements of army administration. At the end of this course and after qualifying at the necessary examinations their commissions are confirmed and their relative places in seniority according to the total marks obtained at all examinations up to that date. Officers Training Corps service with possession of certificate "A" or "B" (medical) carries a definite value in marks in this total.

An entrant who is holding or about to hold at the time of the entrance examination an approved whole-time appointment at a recognized hospital may be seconded while holding such an appointment up to a maximum period of twelve months. A candidate who has held such an appointment within six months of entry may be granted an antedate up to twelve months in respect of the period the appointment was held. This secondment and antedate count in all respects as commissioned service except that pay will not be issued for that period. The Army Council is endeavouring to arrange for all officers who have not themselves obtained a civil hospital appointment to be given a house appointment in a civil hospital for six months' both after they receive their commissions.

After a total period of one year's service at home the young officer goes abroad, probably to India for his first tour of foreign service. Here he gains his first practical experience of tropical disease and tropical hygiene and possibly his first experience of active service on the frontiers of India. His tour abroad lasts five years with probably six months' leave home during that time. On returning home the R.A.M.C. officer has the opportunity to decide whether he will remain in the Corps or accept the gratuity of £1,000 after seven years' service and try his fortune in civil life. If he elects to remain he will be between his eighth and twelfth year of service undergo a course of post-graduate study at the Royal Army Medical College and the London hospitals of five months' duration followed by a course of study of a special subject elected by himself provided he has shown special aptitude in the post-graduate course or during his previous service. During the period of study he remains on full pay and the fees of the course are paid by the State. When qualified in his special subject the officer is eligible for a specialist appointment. The total number of these appointments is 108 and the additional rate of pay 4s. 6d. a day. After this post-graduate course the officer probably proceeds abroad again and promotion to major rapidly ensues. From that time onward he receives regular successive increases of pay and is eligible for additional and charge pay as well. Directorates of hygiene and pathology and the appointment of two serving officers as consultants in medicine and surgery have been instituted and have proved a marked success. All these appointments are of the rank of colonel or major-general and were devised to permit specially selected officers to rise through all ranks to that of major-general on the strength of their professional or purely scientific work.

Under these conditions the possibilities for good workers are very great in the Royal Army Medical Corps. There is scope for original research in tropical disease in preventive medicine and in bacteriology as well as in the large clinical field open to the specialist in medicine, surgery, or gynaecology, in venereal disease, and in

Pay and Allowances at Home

Major General	4 8 4	1 6	4 0	11 0	5 0	2 0	11 0	3 11	2038 0 0	1983 0 0

* Pay Warrant rates (as amended by A O 196/26) less 7 per cent from July 1st 1930 vide A O 237 of 1929 The Pay Warrant rates are subject to revision to an extent not exceeding 20 per cent according to variation in the cost of living. The next revision takes place from July 1st 1931

† Rates of Allowances vary from time to time, and issues are subject to conditions laid down in the Allowance Regulations

ophthalmology Child welfare is also undertaken systematically by officers of the Royal Army Medical Corps At the same time, instruction in administration is continuous There are also many appointments carrying administrative responsibility to those officers who display capacity for this duty

Promotion

Promotion takes place automatically to captain after three and a half years' and to major after twelve years' service, provided the officer is qualified and recommended for promotion Promotion to the higher ranks is by selection from those senior in the rank below, but special promotion by brevet or otherwise is open to officers of the Royal Army Medical Corps

Pay and Allowances

The rates of pay and allowances are given in the table given above In addition, an officer at home in charge of a hospital receives charge pay, the daily amounts being from 2s 6d to 10s, according to the number of beds There are other appointments for which charge pay is given from 5s to 10s daily

Retirement and Retired Pay

Retired pay will consist of two parts (*a*) a service element based on the officer's total service, (*b*) a rank element for the substantive rank from which the officer retires An officer with less than twenty complete years' service will not be eligible for retired pay on voluntary retirement The scale, subject to the reduction of 7 per cent referred to on page 397, is, for the service element, £15 a year for each completed year of service as a medical officer For the rank element the scale is as follows

Substantive Rank from which Retired	After Completing 1 year's Service in the Rank	After Completing each Additional Year's Service	Maximum Rank Element
	£	£	£
Major	12	12	120
Lieutenant-Colonel	150	30	240
Colonel	290	50	390
Major-General	440	50	540
Lieutenant-General	590	50	690

The retired pay of an officer retiring with less than one complete year's service in the rank from which he retires will be assessed as though he had retired from the rank below

Rates of Pay for Officers Serving in India

Rank	Rates of Pay per Month						
	Unmarried			Married			
	Pay of Rank	Unmarried Rates of Lodging Allowance	Total	Pay of Rank	Married Rates of Lodging Allowance	Marriage Allowance	Total
	Rupees	Rupees	Rupees	Rupees	Rupees	Rupees	Rupees
Lieutenant	625	25	650	625	50	65	*740
Captain	755	45	800	755	90	100	*915
Captain after 8 years service	860	45	905	860	90	100	1050
Captain after 10 years' service	930	45	975	930	90	100	1120
Major	1070	55	1125	1070	110	90	1270
Major after 15 years service	1170	55	1225	1170	110	90	1370
Major after 18 years service	1320	55	1375	1320	110	90	1520
Major after 20 years service	1420	55	1475	1420	110	90	1620
Lieutenant-Colonel	1575	75	1650	1575	150	75	1800
Lieutenant Colonel after 3 years service	1750	75	1825	1750	150	75	975

* Married rate of pay is not admissible to officers whose age is under 30

The maximum standard rates of retired pay are as follows

Captain and Subaltern	£300
Major	£450
Lieutenant-Colonel	£600
Colonel	£800
Major-General	£1,000
Lieutenant-General	£1,200

The above rates are those laid down in the Pay Warrant. They have been reduced by 7 per cent. as from July 1st 1930. Further revision may take place triennially to an extent not exceeding 20 per cent. according to variation in the cost of living.

Officers with seven and less than twenty years' service as medical officers may be permitted to retire with a gratuity in accordance with the following scale:

After 7 years' service as a medical officer	£1,000
After 15 years' service as a medical officer	£2,850
After 18 years' service as a medical officer	£3,500

Seconded Service

An officer may be permitted to accept employment in the Foreign or Colonial Offices when so seconded he is not eligible for pay or allowances from army funds but his service continues to reckon towards promotion and under certain conditions towards increase of pay, pension or gratuity.

THE ARMY DENTAL CORPS

The corps is administered by the Director General, Army Medical Services. The regulations for admission to the Army Dental Corps should be obtained from the Under Secretary of State, War Office, and carefully studied.

ROYAL AIR FORCE MEDICAL SERVICE

THE Air Council attaches great importance to attracting into the R.A.F.M.S. the best type of medical man since on the capacity of the medical service depends in a peculiar degree the safety and efficiency of the Royal Air Force. The duties of these medical officers include, not only the prevention and treatment of the ordinary diseases to which the personnel of any fighting service are liable, but the special study of the mental and physical stresses imposed on the airman in diverse circumstances and climates—a new branch of medicine which still provides considerable scope for research.

As promotion to the higher medical ranks is by selection from officers who are eligible by reason of length of service, and as a certain proportion of the higher ranks will be reserved for purely professional as opposed to administrative appointments, it will be seen that there are excellent prospects for the young medical officer who exhibits ability and energy in professional work as well as for those who develop a talent for administration. Duties will, as a matter of course, give him flying experience as a passenger, which is necessary for the proper study of the medical problems of aviation and for gaining first hand knowledge of the conditions under which his comrades serve.

Commissions

The establishment will consist partly of permanent and partly of short service officers.

An officer will on first entry, be granted a short-service commission for a period of three years on the active list (which may be extended to five years at the discretion of the Air Council if the officer so wishes on the recommendation of the Director of Medical Services) and of four years in the Reserve of Air Force Officers. Selections for permanent commissions will be made from officers holding short service commissions and those who are not selected will be transferred to the Reserve at the expiration of their period of service on the active list. For the entrants who desire it the prospect of obtaining a permanent commission is approximately an even one.

Arrangements are in force under which an officer granted a short service commission who has previously held a resident appointment in a recognized civil hospital may, subject to certain conditions, be granted an antedate of the commission equal to the period of the appointment up to a maximum of one year. A similar arrangement obtains as regards a recognized hospital appointment which is held or about to be held at the date when the short-service commission is granted.

An officer who has been seconded or whose commission has been antedated as above will be required to serve for a minimum period of three years on the active list from the date of joining for actual R.A.F. duty.

Officers who have been granted permanent commissions may be permitted to attend, for a period not exceeding nine months, a post-graduate course in general medicine and surgery, tropical and preventive medicine and other special subjects. Such permission may be granted at any time when the exigencies of the service permit during the first sixteen years of service and when attending these courses officers will receive full pay and allowances.

New entrants into the R.A.F.M.S. will be commissioned as Flying Officers (Medical) and will be eligible for promotion to the rank of Flight Lieutenant (Medical) after two years' service. Officers selected for permanent commission will normally be promoted to the rank of Squadron Leader after ten years total service. Accelerated promotion may be granted in a limited number of cases to officers who show exceptional ability after the completion of eight years' service. Promotion

* Except for periods of service under Indian administration. For such periods officers receive pay and allowances at rates and subject to conditions authorized from time to time by the Government of India.

† These allowances are issued only when accommodation for fuel and light rations and personal attendance are not available in kind. Normally accommodation in kind is available for junior officers. ‡ Married rates of allowances are payable only to married officers who have reached the age of 33 or the rank of squadron leader. A colonial allowance is granted in certain commands abroad. The rates and general scheme of allowances are liable to revision as circumstances may require.

within establishment to the rank of Wing Commander will be by selection at any period after sixteen years' total service, and to that of Group Captain by selection at any period after twenty two years' service

There will be no competitive examination on entry, candidates must be under 28 years of age, be British subjects, the sons of British subjects, and of pure European descent and will be interviewed by a Selection Board at the Air Ministry, London, presided over by the Director of Medical Services, Royal Air Force, before acceptance, and will be required to pass a medical examination

On appointment entrants will undergo an initial course, during which they will be given instruction in the special medical aspects of aviation, the organization and administration of the Royal Air Force, and the general and special duties to be performed by officers in the Medical Branch

Uniform Allowance

An allowance of £50 towards the cost of uniform is made on joining to candidates who have not had previous commissioned service in H M Forces

Pay and Allowances

The emoluments of medical officers of the Royal Air Force are given in outline on page 397 The standard rates of pay and retired pay were drawn up on the basis of the high cost of living in 1919, and 20 per cent of each of the standard rates is detachable and subject to alteration upward or downward in relation to the increase or decrease of the cost of living above or below the cost in July, 1919 Under this provision the current rates now in force represent a reduction of approximately 7 per cent on the standard rates The next revision will take effect from July 1st, 1931

Retired Pay

The minimum period of service qualifying for retirement on retired pay is twenty years Standard rates of retired pay are as follows

Air Officers—Air Vice Marshal, £790 to £1,010 per annum, Air Commodore, £650 to £950 per annum

RETIRED PAY (PERMANENT OFFICERS)
Officers Below Air Rank

Age on Retirement	Standard Yearly Rate of Retired Pay	Years of Service	Addition for each Extra Year of Service *	Deduction for each Deficient Year of Service *

53	742	23	22	15
54	765	24	22	15
55	790	24	22	15

* Limited to five years

The maximum standard rates of retired pay and the compulsory retiring ages for the several ranks are

Rank	Yearly Rate of Retired Pay	Compulsory Retiring Age
	£	
Air Vice-Marshal	1 010	60
Air Commodore	950	57
Group Captain	900	55
Wing Commander	600	51
Squadron Leader	500	48

Gratuities

A permanent officer allowed to retire before having qualified for retired pay may be granted a gratuity provided he has not less than ten years commissioned service—namely, £1,500 if he has ten but less than fifteen years' commissioned service, £2,500 after fifteen or more than fifteen years'

Short service officers will be eligible on passing to the Reserve for gratuities on the following scale £100 for each of the first two complete years of service, £150 for each of the third and fourth complete years, and £200 for the fifth complete year, that is, for three years' service on the active list £350, for five years £700

These gratuities will not be payable to officers granted permanent commissions, but their service on a short service commission will count towards retired pay

Further particulars may be obtained on application to the Secretary, Air Ministry (D M S), Adastral House, Kingsway, W C 2

INDIAN MEDICAL SERVICE

IN 1928 the terms on which the Indian Medical Service would in future be constituted were announced The Association has expressed its satisfaction with the new position, and commends the conditions of the Indian Medical Service to the consideration of the junior members of the profession

The new conditions provide, *inter alia*

(i) That the I M S will continue to be retained primarily to meet the needs of the Indian Army, the Local Governments being required to employ a stated number of I M S officers in order to maintain the necessary minimum war reserve and to provide European medical attendance for European officers of the I C S and their families

(ii) That the total number of I M S officers required for civil employment will be calculated at 302, of which 212 will be Europeans and 90 Indians

(iii) That there will be 237 posts for these officers after allowing for leave and study reserve, 178 of which will be in the provinces and 59 under the Government of India

These posts will be filled as follows

Under Provincial Governments 178 posts, of which 112 must be held by European officers, the remaining 66 to be open to Europeans or Indians

Under Government of India 59 posts, of which 28 will be open to Europeans or Indians, the remaining 31 being open to Europeans only

(iv) That the medical requirements of European members of the Superior Civil Services are based on data which will change from year to year as the proportion of European to Indian officers gradually diminishes, and will be subject, therefore, to periodical revision

(v) That certain rules will come into force as an integral portion of the scheme These rules deal with the question of employment on the military and civil side, and provide that there is a liability on the part of all future entrants to the Service to serve on either the military or the civil side, which latter may include service under an Indian administrative chief In practice, however, *an officer is not transferred to civil unless he requests to serve on that side*

Conditions of Service

European candidates for admission to the I M S must be British subjects under 32 years of age, and must be registered under the Medical Acts in Great Britain and Northern Ireland A gratuity of £1,000 on retirement after six years' service, or £2,500 after twelve years' service, together with free return passages, is offered

The Indian Medical Service offers wide opportunities of medical experience, including clinical, preventive, specialist, and research work At the beginning of his career an officer is employed on the military side, which has medical charge of the Indian Army Promotion is on a time scale up to the rank of Lieutenant-Colonel, and by selection to the ranks of Colonel and Major-General After two years' Indian service an officer may apply for transfer to the civil side, from which appointments are made to Civil Surgeoncies, which are established at the principal civil centres to provide for the medical needs of civil officials and for general medical administrative purposes, to specialist (for example, public health and bacteriological) services, to research posts, and to professorships at the Medical Schools

The monthly rates of pay for European officers in the Service who have a "non-Asiatic" domicile are as follows

Rank	Service in Rank	Basic Pay	Overseas Pay	Year of Total Service
1	2	3	4	5
		Rs	Rs	
Lieutenant		500	150	1st
			150	2nd
			150	3rd
Captain	(i) During first 3 years service as Captain	650	150	4th
			£15	5th
			£15	6th
	(ii) With more than 3 and less than 6 years service as Captain	750	£25	7th
			£25	8th
			£25	9th
	(iii) With more than 6 years service as Captain	850	£25	10th
			£25	11th
			£30	12th
Major	(i) During first 3 years service as Major	950		
	(ii) With more than 3 and less than 6 year service as Major	1100		
	(iii) With more than 6 years service as Major	1250		
Lieut Col	(i) Until completion of 23 years total service	1500	£30	13th and over
	(ii) During 24th and 25th years total service	1600		
	(iii) After completion of 25 years total service	1700		
	(iv) When selected for increased pay	1850		

Extras—In addition to the above rates various allowances are admissible for a large number of special appointments on both the military and the civil side which may be held by members of the Indian Medical Service Special high rates of pay are also attached to the numerous administrative appointments open to officers in both branches of the Service

Candidates possessing certain higher medical qualifications may be granted an antedate of one year in the commission Passage in certain hospital appointments may also render candidates eligible for an antedate of one year Persons holding or about to hold resident posts at recognized hospitals may be seconded in those posts for a period not exceeding one year The maximum period of antedate and secondment combined is limited to one year

Officers on appointment will receive an outfit allowance of £50 With the exception of Administrative Officers military or civil officers holding certain special appointments officers are not debarred from taking private practice so long as it does not interfere with their proper duties

The rates of pension are as follows

After 17 years service for pension	Per annum
,, 18	£
19	400
20	430
21	460
22	500
23	540
24	580
25	620
26	660
27	700
	750
	800

These rates are subject to alteration on account of a rise or fall in the cost of living as compared with the year 1919 to an extent not exceeding 20 per cent in all the reduction being under taken triennially with effect from July 1st 1927 A reduction of 4½ per cent has been made on this account from the amounts shown

There are additional pensions ranging from £65 to £350 per annum for officers who have held administrative appointments An officer on appointment is provided with a free passage to India The wives and families of officers who are married prior to the date of the officers embarkation on first appointment will also be provided with free passage to India subject to the payment of messing charges Officers and their families are also eligible for passage concessions under which they are granted a certain number of return passages home at Government expense during their service

Officers are required to undergo courses of instruction at the Royal Army Medical College and at Aldershot lasting approximately six months prior to their embarkation for India on first appointment

Further particulars may be obtained from the Under Secretary of State for India Military Department India Office London, S W 1

PRISON MEDICAL SERVICE

CANDIDATE for the prison medical staff are approved by the Secretary of State for the Home Office on the recommendation of the Prison Commissioners The Chairman of the Board is Mr A Maxwell C B Application for employment may be made to the Board on a special form which can be obtained from the Secretary Prison Commission Home Office London S W 1

In the smaller prisons the medical officer is usually a local practitioner but in the larger the members of the medical staff are required to devote their whole time to the service In the case of those required to give their whole time to the service the appointment in the first instance is to the post of medical officer Class II and from the seniors of this rank the medical officers Class I are selected as vacancies occur

Largely as a result of action taken by the British Medical Association some years ago the salaries of prison medical officers were improved, and now are Medical officer Class II £350 rising by annual increments of £20 to £600, medical officer Class I £650 rising by annual increments of £25 to £800 Unfurnished quarters are provided, or an allowance in lieu is made The civil service bonus is paid on the salary The Association has recently represented to the Royal Commission on the Civil Service in connexion with a proposal to stabilize salary and bonus that the remuneration of prison medical officers should be increased

There are 15 medical officers Class II 12 medical officers Class I, and 23 part-time medical officers The service is a small one and therefore vacancies are comparatively rare and promotion is very slow

LOCAL GOVERNMENT (POOR LAW) MEDICAL SERVICES

A considerable change in administrative conditions in the Poor Law in England and Wales has been effected by the passing of the Local Government Act 1929 which April 1st 1930 abolished the old boards of guardians and transferred their functions to the county councils and county borough councils This should result in a higher degree of specialization in Poor Law work particularly on the medical side and a closer assimilation to other public health services

A number of whole-time appointments exist under these new Poor Law authorities in Great Britain certain of which notably in the metropolis and the chief provincial cities maintain large well-equipped hospitals organized under purely medical administration Posts are available to medical practitioners as superintendents and assistant officers in hospitals and infirmaries and as resident officers in other institutions such as poorhouses workhouses etc Conditions and salaries show considerable variation Salaries for resident assistant medical officers in Poor Law infirmaries usually range from £200 to £450 a year with full board the duties being much the same as but as a whole more responsible than those of a house-physician or house-surgeon in a general hospital Medical superintendents are paid from £600 to £1 600 a year with house, light coal laundry, etc and in some cases the first assistant is termed deputy medical superintendent and receives £450 to £750 a year with similar emoluments This service therefore, offers openings for young practitioners and the prospect of a reasonable degree of progressive security of tenure and provision for superannuation It should be added that the attractiveness or otherwise of any particular post has been and still may be in some degree affected by the policy adopted by the authority under whose jurisdiction it falls In the more advanced tendencies in such areas as has been to develop the hospital services on lines approximating to those ruling in the voluntary hospital In the majority of Poor Law institutions however lax control through the administration by a workhouse master of the whole organization has been preserved and medical appointments in such circumstances are less attractive

In addition to the full-time appointments of the character mentioned the Local Government (Poor Law) Service offer numerous part time posts such as those of district medical officer parish medical officer etc which are practically all held by general practitioners Public vaccinators are also appointed under contract with the council of the counties and county boroughs except in London where the municipal boroughs are responsible for the vaccination service

MEDICAL PRACTICE IN BRITISH DOMINIONS AND FOREIGN COUNTRIES

MEDICAL Acts have now been passed in almost all places forming part of the British Empire leaving the sea and registers of duly qualified practitioners are consequently maintained To these registers medical men educated in the United Kingdom are generally admissible on payment of a registration fee providing them produce evidence that they are of good repute and are otherwise eligible for registration in the United Kingdom as the local requirement may be The only exception to this statement that need be made relates to the Dominion of Canada Each of its provinces acts in medical matters as an independent State The result has been that reciprocity of practice has in the past been established between this country and all the provinces of Canada except British Columbia where certain obstacles were never overcome It has, however to be recorded that reciprocity with Saskatchewan, New Brunswick Ontario and Quebec has recently been brought to an end by those provinces

We would advise any medical man proposing to practise in Canada first to communicate with the Provincial Registrar, stating what degrees or diplomas he holds, and asking for information as to the precise steps he must take in order to obtain admission to the Provincial Register The Licence of the Dominion Council, which can only be obtained after examination, entitles its holder to practise in any of the provinces of Canada, though in regard to Quebec there is a proviso that "he must have been registered in the province five years prior to the application for the recognition of the Dominion Licence" In order to sit for the examination for the Dominion Licence, it is necessary to obtain a licence from one of the provinces, but this can be obtained from one of those with whom reciprocity has been established

Italy and Japan are the only two foreign States with which complete medical reciprocity has been established, though there are other countries which grant a limited recognition to British qualifications Generally speaking, in Continental countries (with the exception of the kingdom of Italy) a British medical man desiring to exercise his profession therein must pass practically the same examinations as those imposed on natives of the country The same observation applies to all foreign States in the South American continent Each of the United States of North America has its own laws and regulations governing medical practice, and all of them require the holder of a British qualification to submit to an examination A number of the States, including New York, Illinois, Michigan, and Indiana, require naturalization

A pamphlet showing the conditions under which medical and dental practitioners legally qualified in their own country may practise abroad can be obtained from the office of the General Medical Council, 44, Hallam Street, Portland Place, London, W 1, price 2s 6d, or 2s 9d post free in the United Kingdom Practitioners who think of going abroad to practise will find therein much useful information, including the name of the official in each country to whom requests for further particulars should be addressed A new edition was published in 1929

MEDICAL APPOINTMENTS IN THE COLONIES AND MANDATED TERRITORIES

MEDICAL appointments in the self-governing Dominions and the territories under their control, and in Southern Rhodesia and Malta, are made by the Governments concerned, and are not in general open to candidates in the United Kingdom In Ceylon, Mauritius, Jamaica, Barbados, the Bahamas, and Bermuda vacancies are practically always filled by the appointment of qualified local candidates or, in the case of some of the higher posts, by transfer from other colonies Appointments to the medical services of the remaining colonies and other territories under the administrative direction of the Colonial Office are made by the Secretary of State for the Colonies in this country Such appointments are to a given colony or group of colonies, for there is no unified service directly administered from the Colonial Office It follows that conditions of service and superannuation are in the main determined by the economic resources and general public health policy of the individual colony and its local government, and vary almost as widely as do conditions of climate Moreover, the extent of the control exercised by the Colonial Office varies according to the constitutional status of the particular colony, and the detailed information available centrally is not always complete The intending candidate, therefore, should make comprehensive inquiries as to local conditions, and particularly as to facilities for private practice where this is included in the terms of appointment He will also do well to supplement official information by reference to the Medical Secretary at the Central Office of the British Medical Association (Tavistock Square, London, W C 1), where reports obtained from time to time from the local Branches are available This is the more necessary because facilities for transfer from the medical service of one colony to that of another are as yet practically non-existent, except in connexion with specialist and senior appointments This sets strict limits upon the opportunities for promotion

To those physically and mentally suited to the climatic and social conditions peculiar to the various colonies the Colonial Medical Services should, and in some cases do, offer a field of professional activity rich in interest and in opportunity for pioneer work, with increasing facilities for specialization and research

The prevailing trade depression and the consequent curtailment of revenue have inevitably affected the health programme among other activities of the Colonial Governments, but this temporary check is offset by growing appreciation among the local administrations of the potentialities of sanitation and the quickened parliamentary and departmental interest in the development of a sound medical policy It is significant that in the first six months of its existence the Colonial Development Advisory Committee has spent a total of £120,000 in grants and loans for schemes for promoting the health of local communities in the various colonies, while an interdepartmental committee has been appointed to frame comprehensive proposals for ensuring the best possible use of available funds in the promotion of medical research and the application of its results to public health problems in the Colonial Empire The recommendations of the committee on the system of appointment in the Colonial Office and the Colonial Services, published in May, 1930, mark an important step in the development of the Colonial Services in general, including the medical services Acceptance by the Secretary of State for the Colonies and the Colonial Office Conference of the principle of unification has at last cleared the way for the elaboration of practical schemes for its application Such unification would secure to members of the smaller medical services much-needed opportunities for promotion by transfer Meanwhile, reorganization of the work of the promotions branch of the Colonial Office on the lines recommended by the committee should lead to welcome improvements in more than one direction

The outlook for the Colonial Medical Service is thus in the main a hopeful one, and especially so in the larger and better organized branches It is unfortunate that this cannot be said of all of the smaller services These are in some cases still hampered by conditions which make efficiency unattainable Hence the urgent necessity remains for making careful and sufficient inquiry as to the position in any given service before accepting appointment

The medical services recruited in this country by the Secretary of State for the Colonies include those of West Africa, East Africa, Malaya, Hong-Kong, the West Indies, Fiji and the Western Pacific territories, and Palestine, besides a number of smaller services offering individually one or two appointments at an inadequate remuneration and with no prospect of promotion Of late years certain medical appointments in the service of the Government of Iraq have been filled with the concurrence and normally upon the recommendation of the Secretary of State, but political conditions make fresh vacancies unlikely at present

In the Fiji Medical Service, although the basic salary of district medical officers (£500, by £25 to £725) is below the £600 minimum recommended as adequate by the British Medical Association, this fact is offset by the concession of allowances of from £175 to £275 in five of the districts, the value of private practice in the remaining seven being estimated at from £100 to £600 a year

The services in the West Indies and some of the smaller colonies have not yet conceded the £600 minimum commencing salary, and whilst facilities for remunerative private practice, general conditions of service, and a relatively low cost of living must in some instances be taken into consideration, these compensations are by no means universal The service in the Leeward Islands is in a condition which requires special notice by way of warning, but the position in the Windward Islands has now been considerably improved

In general, candidates for these services must be between the ages of 23 and 35, although these limits are not for the moment absolute Appointments are, subject to a varying period of probation, for the most part classed as permanent and pensionable, but there are some appointments by agreement for a specified limited term of service

There is no entrance examination, but practitioners selected for appointment must obtain a certificate of physical fitness from one of the consulting physicians to the Colonial Office. Post-graduate experience in hospital appointments is desirable, and in some cases special allowances are conceded to the holders of a D.P.H. Successful candidates are normally required to undergo an approved course of instruction in tropical medicine, the fees for their tuition being defrayed by the Government and an allowance being paid during their instruction.

There are appointments open to qualified medical women, chiefly in the larger services—for example, of East Africa, West Africa, and Malaya. At present one-sixth medical women are employed in child welfare, maternity, and laboratory work. Salaries are the same as for men.

The bulk of the appointments made by the Secretary of State in this country are to the West African Medical Staff, the East African Medical Service, and the Medical Services in Malaya. These are the strongest individual services numerically, and therefore offer more frequent vacancies, better prospects of promotion, and better chances of specialist appointments than the smaller services.

West African Medical Staff

This is amongst the best organized and best paid of the Colonial Services. The territories covered by it include Nigeria, the Gold Coast, Sierra Leone, and the Gambia. Climatic conditions vary considerably in the area, but there are in general admittedly true tropical conditions, which is at present recognized by the provision of [illegible] leave periods than are usual elsewhere.

The service includes medical public health and specialist [illegible] filled by promotion from the staff. The [illegible] a medical officer is £660 on appointment [illegible] annual increments to £960 together with a [illegible] allowance of £72 a year after reaching £720. There are a considerable number of specialist and administrative posts carrying relatively high salaries, ranging from £1,300 with duty allowance of £260 to £1,600 with duty allowance of £260. All appointments in the staff are pensionable. Officers may retire voluntarily or reaching 50 years of age and may be called upon to retire at 55. Pensions are calculated at the rate of 1/480th of the officer's pensionable emoluments (salary and house allowance) in respect of each complete month of service. Alternatively a gratuity and reduced pension may be granted, if desired, under certain conditions. Gratuities of £1,000 or £1,250 may be drawn on retirement after nine or twelve years service. Members of the West African Medical Staff are not usually permitted to take their wives or young children with them until they have acquired experience of the conditions of life and have obtained the sanction of the Governor. In the case of young children this is only exceptionally given.

African Medical Officers.—The Medical Staff is limited to British subjects of European parentage but a number of Government appointments for African medical officers exist in the West African Colonies. The appointments carry salary on the scale £570-£25-£600 and there is a higher scale £600-£30-£720. In addition in Nigeria and the Gold Coast arrangements have been made for the employment of a few young African medical men temporarily on the hospital staffs with a view to appointment to the Government service later if suitable. In such cases a salary of £400 a year is paid.

East African Medical Service

This service includes Kenya, Uganda, Tanganyika Territory, Nyasaland, Zanzibar, and British Somaliland. In East Africa there is very wide scope for clinical work, both medical and surgical as well as for research and for preventive medicine and sanitation. The service as a whole is fully alive to its responsibilities and opportunities individual initiative is encouraged, and the career of a medical officer depends, not on seniority alone but to a large extent on his own capability. In all but a few stations conditions allow a medical officer's wife to accompany him, but this is not generally desirable on first appointment. In some dependencies the consent of the Governor must be obtained. The service includes a medical and a sanitary division. The former is open to those holding ordinary medical and [illegible] qualifications post-graduate experience in a hospital [illegible] ment being an advantage. Posts in the sanitary division will as far as possible be filled by those holding a Diploma in Public Health or a Diploma in Tropical Medicine and Hygiene. Climatic conditions vary considerably in the different parts of the East African Dependencies but there are more conditions approximating to tropical zone where conditions are more close to those in West Africa. The [illegible] of pay for a medical officer is from £600 rising by annual increments of £30 to £720 subject to an efficiency bar at this point. Holders of the D.P.H. receive a special [illegible] to two increments on appointment or on obtaining the diploma thus reaching the grade two years earlier than otherwise. Private practice may be permitted under certain circumstances but there is no right to it.

Officers in the West African Medical Staff apply for appointment to the East African Services in general and is liable to transfer to any particular colony and his wishes will, as far as possible be met as far as possible. As a rule promotion takes place on promotion or at an officer's request. The gratuities available on retirement after five years service are similar to those for the African Medical Staff. Officers may elect or may be required to retire on pension on reaching the age of 55. Pensions are calculated at the rate of 1/480th of emoluments (including value of free quarters) for each completed month of service.

Medical Services in Malaya

These services cover the Straits Settlements, the federated Malay States, the unfederated States, and the State of Brunei in Borneo. The salary of £600 dollars a month, rising by 25 to £00 dollars, plus a temporary allowance of 10 per cent for single and 20 per cent for married officers, is generally considered adequate. A non-pensionable allowance of 100 dollars a month is paid to officers holding the D.P.H.

The climate of Malaya, for the Tropics very much altered, varies little during the year. The mean maximum and minimum temperatures are 86·8° and 74·3° F. In some parts there are no marked rains and dry season, the rainfall being evenly distributed throughout the year. In others there are a couple of dry months and a couple of exceptionally rainy months in the year. The average rainfall is about 100 inches a year and vegetation is always green. People who lead regular active lives have no difficulty in keeping in good health. European children do well in Malaya up to the age of about 6. Numerous but bungalows are available already for rest and change and a large Malayan hill station is about to be constructed at a height of over 5,000 feet at Cameron's Plateau, on the Perak-Pahang boundary.

The professional duties of a medical officer may include medical, surgical, medico-legal, and public health work. His administrative work comprises hospital administration, diets, returns, and financial work, and includes the inspection of smaller hospitals and dispensaries. Clerical work is reduced to the smallest possible amount. Every endeavour is made to consider an officer's own bent when posting him for duty. Districts vary in size and a certain amount of travelling will be necessary. The white population in each district varies. The district hospitals hold from 50 to 300 beds. There is a staff of locally recruited medical men, mostly trained at the Singapore College of Medicine. Asiatic dressers and trained hospital assistants are employed in hospitals and dispensaries. In addition to European sisters there is a large local nursing staff. All hospital equipment is supplied by Government, including instruments. At both the Institute for Medical Research in Kuala Lumpur, Federated Malay States, and the King Edward VII College of Medicine, Singapore,

there are opportunities for research as well as for routine investigations Promising officers may be stationed at the Institute for short periods if they can be spared from other duties In addition to the full-time professional posts at the College of Medicine, several of the medical staff in Singapore hold part-time lectureships

It may fairly be said that the Malayan Medical Services now offer considerable scope for suitable candidates There are relatively to other services a large number of special appointments available in surgery, radiology, public health, and pathology, and to those seeking a career in teaching the professorships at the College of Medicine, Singapore, offer an additional attraction

SUDAN MEDICAL SERVICE

This service is a department of the Sudan Government, and includes a number of Syrian medical officers and a number of assistant medical officers who are natives of the Sudan The British medical inspectors are from the outset senior to all other medical officers The service offers ample opportunities for specialization and for research, as well as for general medical and surgical work

The climate varies, but is not in general unfavourable, though hot In the northern desert the nights are cool, even in summer, and the winter is pleasant and often cold In the central zone there is a rainy season of about four months, during which large areas become malarious The south is more tropical in character, and mosquito-protected houses, nets, and protective quinine are essential during the greater part of the year, though even here the winter months are cool and pleasant It is not considered desirable for medical inspectors to be accompanied by their wives until they have gained some knowledge of the language and the general conditions of life

The commencing pay of a medical inspector is £E 720 On confirmation of appointment and success in the requisite examinations in Arabic the salary is increased by periodic increments to £E 1,200 Five senior administrative posts carry higher salaries There is a compulsory contribution of 5 per cent of pay towards pension, which, for a medical inspector, amounts, after twenty years' service, to £E 500 a year An officer who is compulsorily retired before completing fifteen years' service is not entitled to pension, but receives a gratuity

OFFICIAL SOURCES OF INFORMATION

All inquiries in connexion with medical appointments in the self-governing Dominions and their dependencies should be addressed to the High Commissioners or Agents-General for the Dominions Intending applicants are also recommended to consult the Dominions Office and Colonial Office List, which may be seen at the Colonial Office Library or at the Library of the British Medical Association if not otherwise available, and the Professional Handbook, Part III (price 9d), issued by the Overseas Settlement Department, Dominions Office, Caxton House, Tothill Street, London, S W 1

The position in Egypt is at present uncertain, questions as to the possibility of any medical appointments becoming available under the Egyptian Government should be addressed to the Director-General, Public Health Department, Cairo

Inquiries as to vacancies and conditions in the Sudan Medical Service should be addressed in the first instance to Dr Hodson, 24, Welbeck Street, London, W 1

All inquiries in connexion with Colonial medical appointments made by the Secretary of State for the Colonies, or such vacancies as may occur in Iraq or Palestine, should be addressed to the Private Secretary (Appointments), Colonial Office, 2, Richmond Terrace, Whitehall, London, S W 1

There remain a number of medical appointments made by mining companies and other commercial undertakings in various parts of the Tropics Much caution should be exercised in accepting such posts, and the form of contract should be subjected to very careful scrutiny Advice in this connexion should always be sought from the Medical Secretary of the British Medical Association, British Medical Association House, Tavistock Square, London, W C 1

DEGREES FOR PRACTITIONERS

AT one time it was the almost universal custom for medical students educated in London and aiming at general practice not to seek a university degree, and as that custom still prevails to a considerable extent a large proportion of medical men in England possess diplomas or licences to practise but not degrees in medicine This is a fact which they sometimes find reason to regret, and to such practitioners the following paragraphs may be of interest It should be noted that the M D Brux diploma, if obtained since June, 1886, is not registrable in this country, and that the University of Brussels no longer holds special examinations for foreign medical practitioners Moreover, after 1932 the University of Durham will hold no further examinations for the degree of M D for practitioners of fifteen years' standing

UNIVERSITY OF DURHAM

The degree of M D is granted by the University of Durham to registered practitioners of not less than fifteen years' standing, who have been qualified and in practice for that period, upon the following conditions, without residence The candidate must be 40 years of age, and must produce a certificate of moral character from three registered medical practitioners Should he not have passed an examination in arts previous to the professional examination in virtue of which his name was placed on the *Register*, he is examined in classics and mathematics, if otherwise, he is required to translate into English passages from any one of the following Latin authors Caesar, *De Bello Gallico* (first three books), Virgil, *Aeneid* (first three books), or Celsus (first three books) Natives of India or the British Colonies are placed on the same footing as natives of Great Britain, and must be registered on the books of the General Medical Council of the United Kingdom

Professional Examination.—The candidate must pass an examination in the following subjects (i) Principles and practice of medicine, including psychological medicine, hygiene, and therapeutics, (ii) principles and practice of surgery, (iii) midwifery and diseases of women and children, (iv) pathology, medical and surgical, (v) anatomy, medical and surgical, (vi) medical jurisprudence and toxicology Candidates are examined by means of written papers, clinically, and viva voce at the College of Medicine, Northumberland Road, Newcastle, and in the Royal Victoria Infirmary The classical part of the examination may be taken separately from the professional on payment of a portion (£10 10s) of the full fee

The examinations are held twice a year, in June and December Notice, accompanied by the fee and certificates, must be sent to the Secretary of Examinations, at the University of Durham College of Medicine, Newcastle-on Tyne, at least twenty-eight days before the commencement of the examination

Fees.—The inclusive fee for both professional and classical parts of the examination together with the degree fee is 50 guineas, if a candidate fail to pass, 20 guineas are retained, but if he present himself again 40 guineas only are required

[*Note*.—It has been decided by Senate that examinations for this degree shall be discontinued after June, 1932]

THE SWISS UNIVERSITIES

The Universities of Lausanne and Bern have arrangements which permit British practitioners to proceed to the M D degree, but this alone does not confer the right to practise in Switzerland, for which the possession of the State or Federal Diploma is necessary Neither degree nor diploma is registrable in this country

At Lausanne the British practitioner has to produce (1) a certificate of matriculation in a British university or of having passed a preliminary examination recognized by the General Medical Council for registration as a medical student (2) a certificate of a degree or diploma qualifying for practice in the United Kingdom and the certificate of registration as a medical practitioner in the United Kingdom He must then undergo a viva voce examination in three subjects of the final examination Next he must present a thesis for the doctorate prepared and completed in one of the Lausanne clinics under the direction of a professor of the Faculty of Medicine Residence for a semester (October to March or April to July) is obligatory Applications for admission should be made to the Dean of the Medical Faculty, Ecole de Médecine, Place de l'Ours, Lausanne Dr C A H Franklin (56, Southborough Road, Bickley, Kent) honorary secretary of the Lausanne Medical Graduates, will supply further information

SPECIAL DIPLOMAS

INFORMATION about the regulations for the various Diplomas in Tropical Medicine, in Psychological Medicine, and in Public Health is given in the appropriate sections of this Educational Number (pages 357, 389 391) Further details in regard to the D P H and the D T M will be found in Sir Andrew Balfour's *Guide to the Regulations, Courses, and Examinations for Qualifications in Public Health and Tropical Medicine*, published by the British Medical Association Tavistock Square, W C 1 at the price of 3s

It should perhaps be noted here that of the various diplomas in special subjects granted by licensing bodies only those in Public Health and Sanitary Science and State Medicine are at present admissible for entry in the official *Medical Register* though other special diplomas may, of course, be included among the particulars of qualifications set out in the *Medical Directory* As stated at page 361, a Diploma in Tuberculous Diseases is granted by the University of Wales to qualified medical practitioners, new regulations for this diploma are now in force

DIPLOMAS IN MEDICAL RADIOLOGY

Diplomas in Medical Radiology are granted by the Universities of Cambridge, Edinburgh and Liverpool

The Cambridge Diploma—A Diploma in Medical Radiology and Electrology is granted by the University of Cambridge The primary object is to provide adequate training in a branch of medical work which is becoming increasingly important and difficult, and which is outside the ordinary medical curriculum The diploma is open only to those who hold a medical qualification approved by the Diploma Committee Under the new regulations, which came into operation in October 1928 the course has been extended from six to nine months The first three months (October to December) which may be spent either in Cambridge or in London are occupied with lectures and practical work in physics and electrotechnics together with an introductory course in medical radiology and electrology The work for the second three months (January to March) can be done in London only, and comprises lectures and clinical instruction in radiology and electrology given by lecturers appointed by the Educational Committee of the British Institute of Radiology, together with clinical experience in the radiological department of a hospital recognized for that purpose by the Diploma Committee During the last three months a candidate is required to hold a clinical clerkship or other similar appointment in the radiological department of a recognized hospital in London, have been recognized by the Committee for this purpose In exceptional circumstances exemption from this regulation may be granted by the Committee The examination for Part I (physics and electrotechnics) is normally taken at the end of the first three months and the conclusion of the nine months course a candidate is required to present a thesis which is composed by himself This thesis is to be in the form of a critical report with notes upon six cases either in radiology or electrology or in both these subjects and must illustrate various methods of diagnosis or treatment The course for 1930–31 begins on October 1st Examinations for Part I will begin on January 7th and April 14th 1931 and for Part II on April 15th and July 15th, 1931 Further particulars of the courses and examinations can be obtained from the Secretary for the Diploma G Stead M A Cavendish Laboratory Cambridge or from Dr A E Barclay Radiological Department Medical Schools Cambridge or from the Secretary, British Institute of Radiology 32 Welbeck Street, London W 1

The Edinburgh Diploma—Candidates for the diploma must be graduates in medicine and surgery of the University of Edinburgh or hold corresponding registrable degrees or qualification from some other licensing body Candidates are not admitted to the examination for the diploma until after the lapse of not less than one year from obtaining a registrable qualification which qualification must be registered before admission to the examination The course of study begins in October and extends over a period of not less than three terms The examination, which is written oral and practical is in two parts (*a*) physics, and (*b*) radiology The examination is held twice yearly—namely, July and October Full particulars may be obtained from the Dean of the Faculty of Medicine In this connection it may be noted that radiology can now be taken as the special subject in the examination for Membership of the Royal College of Physicians of Edinburgh Several candidates have already taken radiology as their special subject, it means that an honours standard has to be attained

The Liverpool Diploma—The University of Liverpool grants a Diploma in Medical Radiology and Electrology Candidates before admission to the examination for the diploma must possess a registrable qualification approved by the university in medicine and surgery, and must have attended courses of instruction in (*a*) physics (two terms), (*b*) (i) radiology and (ii) electrology during the six months in the x ray and electro-therapeutic departments of a hospital or hospitals An examination is held in March each year, the subjects being (*a*) physics (*b*) radiology and electrology Examination in either part may be taken separately Fees tuition £24 5s examination and diploma £6 5s A registration deposit fee of £5 5s is charged on application and credited to the fees but is not returnable in the event of the candidate failing to register These courses commence during the first week in October Application should be made to the Dean Faculty of Medicine, the University of Liverpool

DIPLOMAS IN LARYNGOLOGY AND OTOLOGY

The Conjoint Examining Board in England (Examination Hall, Queen Square London, W C 1) grants a Diploma in Laryngology and Otology (D L O) after an examination held in June and December The examination comprises two parts Part I, on the anatomy embryology, and physiology of the ear nose pharynx larynx trachea and bronchi and oesophagus Part II on the recognition and use of special instruments and appliances and the medicine surgery and pathology of these regions Candidates may enter for Part I at any time after a registrable qualification in medicine surgery and midwifery has been obtained Candidates may enter for Part II on completion of one year of special study of diseases of the ear nose pharynx and larynx after a registrable qualification has been obtained provided that Part I has been previously passed and on production of certain certificates The conditions of study may be modified at the discretion of the Committee of Management in special cases The fee for admission or readmission to each part is six guineas

DIPLOMAS IN OPHTHALMIC MEDICINE

A special Diploma in Ophthalmic Medicine and Surgery is granted by the University of Oxford and by the Conjoint Examining Board in England

University of Oxford—For the Diploma in Ophthalmology (D O) attendance on a twelve months' course of clinical ophthalmology in hospitals or institutions recognized for the purpose by the Board of the Faculty of Medicine, and on a course of instruction in Oxford lasting two months is obligatory Candidates must have their names on the *Medical Register* of the United Kingdom unless being Bachelors or Doctors of Medicine of universities outside the United Kingdom they have obtained special permission from the Board of the Faculty of Medicine

The Conjoint Board—The Diploma in Ophthalmic Medicine and Surgery of the Conjoint Examining Board of the Royal College of Physicians of London and Royal College of Surgeons of England is issued after completion of an examination held in two parts—in January and July The examination in each case is partly written partly oral partly clinical or practical Part I comprises anatomy and embryology of the eye optics visual apparatus physiology of vision elementary ophthalmic medicine and surgery, defects of the eye ophthalmic medicine and surgical pathology with special reference to medical and surgical ophthalmology Candidates may enter for Part I at any time after a registrable qualification in medicine surgery, and midwifery has been obtained Candidates may enter for Part II on completion of one year of special study of

ophthalmology after a registrable qualification has been obtained, provided that Part I has been previously passed, and on production of certain certificates The conditions of study may be modified at the discretion of the Committee of Management in special cases The fee for admission or readmission to each part is six guineas

DIPLOMAS IN OBSTETRICS

The Society of Apothecaries of London, as stated on page 362, has now instituted a Mastery of Midwifery, and issues a diploma under this title denoting the possession of specialized knowledge of ante-natal care, midwifery, and child welfare The diploma is however, not registrable under the Medical Acts

The Conjoint Examining Board in England has issued this year regulations for its new Diploma in Gynaecology and Obstetrics (D G O, R C P & S Eng), the first examination for which will be held in October next, and the second in April, 1931 Those eligible for admission to examination must have held a degree in medicine and surgery recognized by the Board, or a qualification registrable in this country, for not less than three years The subjects of the examination are gynaecology and obstetrics (including pathology, histology, and bacteriology in relation to these subjects), and ante-natal, post-natal, and infant welfare work The examination is written, oral, and clinical, but only those candidates are admitted to the clinical who satisfy the examiners in the written and oral A form is issued on which particulars have to be given and certified as to resident appointments in the gynaecological and obstetrical department of a recognized general hospital, in a gynaecological hospital, or a maternity hospital, or as to registrarship or clinical assistantship held in such institutions, together with particulars as to regular attendance, with responsible care of patients, at recognized ante-natal, post-natal, and infant welfare clinics during twelve months It is added that these conditions of study may be modified in the case of a candidate who has carried out original investigations or written a thesis on some subject in gynaecology or obstetrics, or whose studies have extended over a prolonged time without fulfilling the exact conditions set out, but exemption will not be granted from any part of the examination The fee for admission to examination or re-examination is ten guineas Copies of the regulations for this diploma may be obtained from the Secretary, Examination Hall, Queen Square, W C 1

The British College of Obstetricians and Gynaecologists, founded last year, has power under its memorandum of association, either alone or in co-operation with authorized teaching and examining bodies, to grant to registered medical practitioners diplomas or other equivalent recognition of special knowledge of obstetrics and gynaecology *Diplomas granted independently by the College, however*, will not of themselves confer any legal qualification to practise, and will embody a statement to the effect that they have been issued by the authority of the British College of Obstetrics and Gynaecologists alone A report of the first general meeting of the Fellows and Members of the new College appeared in our issue of December 21st, 1929 (p 1173)

MEDICAL MISSIONARIES

MISSIONARY societies are in constant need of qualified men and women to fill vacancies as they occur in their hospitals, and also to enable them to take advantage of fresh openings To those suitably endowed the mission field offers unique opportunities for interesting work, and the development of native medical schools, as training institutions in connexion with some of the larger mission hospitals, affords excellent scope for valuable work to medical men and women who are qualified to teach It is not usually expected that medical missionaries should take a position such as would otherwise be occupied by an ordained clergyman or minister, but it is essential that they should be prepared to exert their influence in any hospital to which they may be sent so that a Christian atmosphere may be maintained and the work of evangelization be carried on through the ministry of healing

As for scientific and other qualifications for the work, medical missionaries, in addition to being physically capable of sustaining a life which makes a great *demand upon their* strength, should be thoroughly well-trained physicians and surgeons It is very desirable that they should have held a resident appointment at a general hospital, and have a good knowledge of practical surgery, gynaecology, tropical medicine, and the treatment of eye diseases Useful information can be obtained from the secretaries of the various Missionary Societies, or from Thomas B Adam, Honorary Secretary, Medical Advisory Board on Medical Missions to the Conference of Missionary Societies in Great Britain and Ireland, The Crossways, 45, Kenton Road, Harrow, Middlesex, or 19, Furnival Street, E C 4

Dental Surgery.

UNTIL the passing of the Dentists Act, 1921, the profession of dentistry in this country was regulated by enactments corresponding very closely with those relating to the practice of medicine—that is to say, there was no direct prohibition of the act of practice, and the Dentists Act of 1878 gave the same degree of protection to legally qualified and registered dentists as was accorded to registered medical practitioners—namely, the reservation of the use of certain titles This Act provided also (1) that no person should take or use the name or title of "dentist" (either alone or in combination with any other word or words) or of "dental practitioner," or any other name, title or description expressed in words or by letters implying that he was specially qualified to practise dentistry, unless he was registered, under a penalty of £20 and (2) *that an unregistered person* could not recover any fee or charge in respect of any dental operation, attendance, or advice But, in the case of the practice of medicine by unqualified and unregistered persons, certain deterrent factors came into play—such as the inability to give a death certificate—and these did not operate to the same extent in the case of dentistry hence, unqualified practice was far more prevalent in dentistry than in medicine, and increased after a decision of the House of Lords placing a narrow interpretation upon the words "specially qualified to practise dentistry," by defining the word "qualified" as not referring to competence but to the possession of a recognized diploma

THE DENTISTS ACT, 1921

This unsatisfactory position was remedied by the passing into law of the Dentists Act, 1921 its provisions are based largely on the recommendations of a *departmental committee* appointed in 1917 by the PRIVY COUNCIL "to investigate the extent and gravity of the evils connected with the practice of dentistry and dental surgery by persons not qualified under the Dentists Act" Since November 30th, 1922, no person has been permitted by law to practise or hold himself out, whether directly or by implication, as practising or as being prepared to practise dentistry unless he is on the *Dentists Register* provided for by the Dentists Act, 1878 The practice of dentistry is defined as including "the performance of any such operation and the giving of any such treatment, advice, or attendance, as is usually performed or given by dentists," and the performing of any operation or the giving of any "treatment, advice, or attendance on or to any person as preparatory to or for the purpose of or in connexion with the fitting, insertion, or fixing of *artificial* teeth" The maximum penalty *incurred by an unregistered* practitioner is £100 for each offence There are, however, certain important exceptions to the requirement of registration A registered medical practitioner may practise dentistry without being on the *Dentists Register*, though he may not give dental treatment to insured persons under the National Health Insurance Acts unless he be so registered and a registered pharmaceutical chemist or chemist and druggist may extract a tooth where the case is urgent and where no doctor or dentist is available, but the operation

must be performed without any kind of anæsthetic, further, any person may carry out minor dental work in a public dental service under the personal supervision of a registered dentist provided it is in accordance with conditions approved by the Minister of Health after consultation with the Dental Board

Dentistry may be carried on by a corporate body provided the majority of the directors and all the operating staff are registered dentists and that no business other than dentistry or only some business ancillary to dentistry is carried on by the company. Companies carrying on the business of dentistry at the present time are permitted to continue to do so with certain restrictions provided that the name of the company as well as the names of the directors have been entered in a list kept by the Registrar for that purpose. Every director or manager of a company convicted of an offence under the Act will be held to be guilty of the offence unless he proves that the offence was committed without his knowledge and the court may in addition to a fine order that the name of any director convicted shall be removed from the list of directors aforesaid

THE DENTAL BOARD

On the establishment of the Dental Board in 1921 certain powers and duties of the General Medical Council were transferred to it, including the duty of erasing from the *Dentists Register* any entry which has been incorrectly or fraudulently made. An inquiry into the case of a person alleged to be liable to have his name erased from the *Register* is made by the Board, which reports its findings to the General Medical Council, the order directing the erasure being made by the Council. A name erased from the *Register* can only be restored by the Council upon a report made by the Board. An appeal to the High Court may be made by any person aggrieved either by refusal of the Board to register his name or by the removal of his name from the *Register*. The administrative expenses of the Board are defrayed from the registration fees and annual retention fees but any surplus may be allocated to purposes connected with dental education and research or to any public purpose connected with dentistry. The office of the Dental Board is at 44, Hallam Street, London W.1.

DENTAL EDUCATION AND EXAMINATION

The preliminary examination in arts is the same for medical and dental students, and the early stages of their education embrace much the same subjects[1] and as the dental student is required to obtain a knowledge of the broad principles of medicine and surgery it is necessary for him to pursue some portion of his studies at a medical school as well as at a special dental school the latter not undertaking the teaching of these subjects. Registration as a dental student is not in all cases compulsory though it is to be advised as convenient as affording proof of the commencement of professional education and it is required by most of the licensing bodies all of whom insist upon a curriculum covering four academic years.

Degrees and diplomas in dentistry are granted by the Universities of Belfast, Birmingham, Bristol, Dublin, Durham, Leeds, Liverpool, London, Manchester, St. Andrew's, Sheffield and the National University of Ireland as will be found stated in the articles on these universities. Licences in dentistry entitling the holder to be registered on the *Dentists Register* are granted by the Royal Colleges of Surgeons of England of Edinburgh and of Ireland and by the Royal Faculty of Physicians and Surgeons of Glasgow.

Recognized dental schools are numerous. In London there are those connected with the Royal Dental Hospital, Leicester Square, the National Dental Hospital (now the University College Hospital Dental School), Great Portland Street, Guy's Hospital, King's College Hospital, and the London Hospital. In the provinces there are the Birmingham Dental Hospital, the Royal Infirmary and the General Hospital, Bristol, the Dental Hospital and the Public Dispensary, Leeds, the Dental Hospital, Liverpool, the Dental Hospital, Manchester, the Dental Hospital and School, Newcastle-on-Tyne, the Royal Hospital, Sheffield. In Scotland there are the Dental Hospital, Dundee, the Incorporated Dental Hospital and School, Edinburgh, and the Incorporated Dental Hospital, Glasgow, and in Ireland the Belfast Dental School, the Incorporated Dental Hospital of Ireland, Dublin, and the Royal College of Surgeons in Ireland, Dublin.

All who think of becoming dentists may be advised to study a Memorandum, lately drawn up for their guidance by the Registrar of the Dental Board, setting out in convenient form and in untechnical language information for which requests are frequently made to the Board.[1] It will be seen from this pamphlet that in order to assist suitable students the Dental Board has instituted a system of bursaries to pay the fees of those who have not the financial means to qualify, and in some cases maintenance is given as well.

Recommendations of the General Medical Council

The Dentists Act still leaves to the General Medical Council the duty of controlling the course of study and examinations required for dental qualifications.

The following recommendations as to the course of study and examinations to be required of candidates for degrees or licences in dentistry or dental surgery were adopted by the Council on May 27th, 1922:

Preliminary Examination and Registration

1. That every dental student shall at the commencement of his studentship be registered in the manner and under the conditions prescribed for medical students.

2. That before registration in the *Dental Students Register* every applicant shall be required to have passed in addition to the examination in general education which shall be the same as that required for medical students an examination in Elementary Physics and Elementary Chemistry conducted or recognized by one of the licensing bodies which shall also be the same as that required for medical students.

3. That before registration as a dental student every applicant shall produce evidence that he has attained the age of 17 years.

Professional Study

4. That every candidate for a degree or licence in dentistry or dental surgery shall be required before admission to the final or qualifying examination to produce certificates showing

(i) That he is at least 21 years of age.

(ii) That he has been registered as a dental student.

(iii) That he has subsequently to the date of registration as a dental student been engaged in professional study for at least four years, of which three years at least shall be spent at a school or schools recognized for professional study by one of the licensing bodies.

(iv) That subsequently to the date of registration as a dental student he has attended at a recognized medical school courses of instruction in the following subjects which shall be the same as those required for medical students in the following subjects (a) Chemistry and (b) Physics in their application to medicine, (c) Elementary Biology. That he has attended at a recognized medical school courses of instruction in the following subjects (d) Human Anatomy (with demonstrations) for three academic terms, (e) Physiology (with laboratory instruction including Practical Histology) for two academic terms, (f) General Pathology (including Bacteriology) for two academic terms, (g) Medicine for two academic terms, (h) Surgery for two academic terms, (i) the practice of a recognized general hospital or hospitals of not less than eighty beds with certified instruction in Clinical Medicine and Clinical Surgery *for four academic terms*.

(v) That he has attended at a recognized dental school courses of instruction in the following special subjects (a) Dental Anatomy and Physiology, human and comparative. The course should comprise a minimum of twenty meetings of the class. (b) Practical Dental Histology and Morbid Histology. The course should comprise a minimum of sixteen meetings of the class. (c) Dental Pathology and Surgery. The course should comprise a minimum of twenty meetings of the class. (d) Dental Materia Medica and Therapeutics. The course should comprise a minimum of sixteen meetings of the class. (e) Dental Metallurgy (with practical work and demonstrations). The course should comprise a minimum of twenty meetings of the class. (f) Dental Mechanics (with practical work and demonstrations). The course should comprise a minimum of twenty meetings and two demonstrations. (g) A course of instruction in the use of Anæsthetics general and local employed in dental practice. (h) A course of instruction in Radiology as applied to dentistry.

(vi) That he has for at least twenty four calendar months attended, during the ordinary academic terms the practice of a recognized dental Hospital or of the recognized dental department of a general hospital.

(vii) That he has received for not less than twenty four calendar months or for 2,000 hours practical instruction in dental mechanics.

Professional Examinations

5. That the examination for a degree or licence in dentistry or dental surgery shall be partly written partly oral and partly practical and shall include the following subjects (a) Chemistry, Physics and Biology in their bearing on Medicine and Dentistry. (b) Human Anatomy and Physiology. (c) General Pathology including Bacteriology. (d) Medicine and Surgery. (e) Dental Anatomy and Physiology, Dental Pathology, Dental Surgery (including Orthodontics), Dental Materia Medica and Therapeutics and Dental Mechanics and Dental Metallurgy. (f) Practical Examination in Dental Surgery. (g) Practical Examination in Dental Mechanics and Metallurgy. (h) Anæsthetics general and local, employed in dental practice.

6. That the prescribed subjects of examination may be combined or distributed at the discretion of the licensing bodies and may be taken at two or more successive stages during the course of professional study provided that no candidate shall be admitted to any final examination in dental surgery and final mechanics until he shall have completed the required four years course of study.

ACKNOWLEDGEMENT

THE detailed information published in this Educational Number of the *British Medical Journal* for the benefit of intending students of medicine and newly qualified practitioners has been revised throughout with the co-operation of the deans and secretaries of the medical schools and kindred institutions and of officials in the several public services to all of whom we wish to acknowledge our indebtedness.

THE BRITISH MEDICAL ASSOCIATION PARTY IN CANADA

[FROM OUR SPECIAL CORRESPONDENT]

THE main British Medical Association party *en route* for Winnipeg were welcomed on their arrival at Montreal by Dr BAZIN, President of the Canadian Medical Association, who is professor of surgery at McGill University, Montreal. The party arrived late on the evening of Saturday, August 16th, and were transferred *en bloc* to their headquarters at the Windsor Hotel, one of the enormous C P R hotels which appear to be a prominent feature of most Canadian cities. Sunday was a day of rest, when many of the party attended one or other of the numerous churches of Montreal, and in the afternoon drove along the miles of its beautiful Lake Shore Drive, lined with the summer villas of Montreal townsfolk. On Monday, August 18th, an official welcome was offered to the British Medical Association at the City Hall, in a charming little oration by M. BRUNO CHARBONNEAU, the Pro-Mayor, on behalf of the Hon. Camillien Houde, the Mayor, who was unable to be present. Mr. CHARBONNEAU was supported by Alderman W. S. WELDON in a very witty speech, and Professor Arthur Burgess replied on behalf of the Association. The members of the British Medical Association party then drove in procession through the city of Montreal, visiting its many points of interest, including the great Victoria Bridge across the St. Lawrence, which, with its approaches, is two miles long. At the top of Mount Royal lunch was served, the Association being the guests of the City Council. In the afternoon the party drove out to the delightful Laval sur le Lac Golf Club, where, after a pleasant afternoon in the sunshine—some members actually did golf, while others drove further into the hinterland of the Lake of the Two Mountains—dinner was held, under the chairmanship of Dr. P. Z. Rheaume, President of l'Association des Medecins de Langue Française de l'Amerique du Nord. This was a most enjoyable function, rendered all the more so by two witty speeches, one delivered in French by Sir STCLAIR THOMSON, and the other in an amusing mixture of French, pidgin French, and English by Dr. Alfred Cox. After this, as the official programme announced, "The guests were returned to their hotel." Next morning was spent in visiting McGill University, the Royal Victoria Hospital, and the Montreal General Hospital (Osler's old hospital, senior in foundation to, but not so large as, the Royal Victoria). At McGill University the places visited by most of the party were the Osler Collection of Hearts and Aneurysms in the Pathological Museum, and the Osler Library, where Dr. Francis (the librarian, and Osler's nephew) showed the most precious items under his care, including Sir William Osler's unique and complete collection of every edition of the works of Sir Thomas Browne.

On Wednesday, August 20th, after a night in the very comfortable C P R sleeper, the British Medical Association party visited Niagara Falls. The usual tourist ceremonies were all fully complied with, such as a trip on the steamer *Maid of the Mist*, down the scenic tunnel which opens behind the Falls, and over the whirlpool rapids in the aerial railway. Then the party were entertained to lunch by the Niagara Falls, Ontario, Medical Association (there is another Niagara Falls, New York State), and a welcome was extended to them by the president, Dr. Snyder, and the Mayor of the city. Then on to Toronto by steamer across Lake Ontario—Toronto, unbelievably beautiful, silhouetted against the evening sky.

Up to the night of Thursday, August 28th, the number of registrations at the Annual Meeting of the British Medical Association in Winnipeg was 3,400.

WE deeply regret to announce the death, on August 31st, after an operation, of Dr. CHARLES BUTTAR, who had been for many years a prominent member of Council and committeeman in the central work of the British Medical Association, and was a valued contributor to these columns.

WE have also to announce with much regret the death, on August 31st, from pneumonia following an operation, of Mr. HERBERT W. CARSON, F.R.C.S., senior surgeon to the Prince of Wales's General Hospital, Tottenham, and a Past-President of the Medical Society of London.

ON Monday next, September 8th, the day on which the Council of the League of Nations meets in Geneva, there will also be held a preliminary conference in connexion with the International Congress on African Children, to be held in Geneva in 1931. The congress, which has the support of the British and Belgian Governments and the co-operation of all the leading missionary societies, is being organized by the Save the Children International Union. The purpose of the congress is to consider the present situation in Africa with regard to infant mortality, education, marriage, and labour conditions as affecting children, with a view to comparing existing conditions with the ideals set forth in the Declaration of Geneva. Further information may be obtained from the secretary to the British Committee, 26, Gordon Street, London, W.C.1.

A PROVINCIAL meeting of the Society of Medical Officers of Health will be held at the Grand Hotel, Lowestoft, on Friday, September 19th, at 4 p.m. The subject for discussion is "The public health significance of general medical service schemes," and the speakers will include Dr. Astley Clarke, senior physician, Leicester Royal Infirmary, Dr. C. E. S. Flemming, member of Consultative Council, Ministry of Health, Dr. H. P. Newsholme, M.O.H. Birmingham, and Dr. A. M. N. Pringle, M.O.H. Ipswich. In the evening members will be entertained by the Mayor and Corporation of Lowestoft at dinner. On the following day the council of the society will meet at 10 a.m., and in the afternoon there will be a launch trip on Oulton Broad by invitation of the Eastern branch. Members who intend to be present are asked to notify the executive secretary at 1, Upper Montague Street, Russell Square, W.C.1, by an early post, in order to facilitate the local arrangements.

VACANCIES

ALL SAINTS HOSPITAL FOR GENITO-URINARY DISEASES.—House-Surgeon (male). Salary £150 per annum.

BANGOUR MENTAL HOSPITAL, West Lothian.—Second Assistant Medical Officer. Salary £350 per annum rising to £400.

BATH ROYAL UNITED HOSPITAL.—Assistant House-Surgeon (male unmarried). Salary £120 per annum.

BEDFORD COUNTY HOSPITAL.—(1) House Surgeon. (2) Assistant House Surgeon. Males unmarried. Salary £175 and £130 respectively.

BIRMINGHAM GENERAL HOSPITAL.—(1) Resident Anæsthetist. (2) Three House-Surgeons. Salary for (1) £120 and for (2) £70 per annum.

BOURNEMOUTH ROYAL VICTORIA AND WEST HANTS HOSPITAL.—House-Surgeon (male). Salary £150 per annum.

BRADFORD CITY.—Assistant Bacteriologist. Salary £600 per annum.

BRIGHTON ROYAL SUSSEX COUNTY HOSPITAL.—Casualty House Surgeon (male). Salary £120 per annum.

BRISTOL HOMŒOPATHIC HOSPITAL.—Resident Medical Officer. Salary £140 to £150 per annum.

BRISTOL ROYAL INFIRMARY.—Assistant for Cancer Research Laboratories. Salary £400 per annum.

CAMBRIDGE ADDENBROOKE'S HOSPITAL.—(1) House Surgeon. (2) House Surgeon to the Special Departments. Salary at the rate of £170 per annum each.

CANCER HOSPITAL, Fulham Road, S.W.3.—House Surgeon. Salary at the rate of £100 per annum.

CARDIFF. KING EDWARD VII WELSH NATIONAL MEMORIAL ASSOCIATION. (1) Half-time Assistant Tuberculosis Officer for the Pontypridd Area; salary at the rate of £300 per annum. (2) Area Assistant Tuberculosis Physician, salary £600 per annum.

CARDIFF ROYAL INFIRMARY.—Gynæcological House-Surgeon. Salary at the rate of £50 per annum.

CARDIFF UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE.—Part-time Demonstrator in Anatomy. Honorarium £75 per annum.

CENTRAL LONDON THROAT, NOSE AND EAR HOSPITAL, Gray's Inn Road, W.C.1.—Honorary Assistant Anæsthetist.

CHICHESTER ROYAL WEST SUSSEX COUNTY HOSPITAL.—Assistant House Surgeon. Salary £125 per annum.

DARLINGTON CENTRAL HOSPITAL.—Senior and Junior House-Surgeons (male). Salary £145 and £115 per annum respectively.

DERBY.—THE NEW DERBYSHIRE AND DISTRICT GENERAL INFIRMARY.—Junior House-Surgeon. Salary £150.

DURHAM COUNTY AND NORTHUMBERLAND EAR INFIRMARY.—Clinical Assistant in Out-patient Department. Salary £75 per annum.

GLASGOW UNIVERSITY.—Dr Robert Pelz Lecturer in Materia Medica and Therapeutics.

GREAT YARMOUTH GENERAL HOSPITAL.—Two House-Surgeons, Senior and Junior. Salary £140 and £120 per annum respectively.

HALIFAX ROYAL INFIRMARY.—Third House-Surgeon (male unmarried). Salary £150 per annum.

HULL CORPORATION.—Assistant Medical Officer, Berverley Road Institution (Hospital). Salary at the rate of £400 per annum.

INVERNESS DISTRICT MENTAL HOSPITAL.—Junior Assistant Medical Officer. Salary £150 per annum.

IPSWICH EAST SUFFOLK AND IPSWICH HOSPITAL.—(1) Casualty Officer (2) House-Surgeon. Males. Salary £150 and £120 per annum respectively.

LANARK COUNTY.—Bacteriologist and Pathologist. Salary £750.

LANCASHIRE COUNTY COUNCIL.—(1) Assistant County Medical Officer, salary £630 a year rising to £1,000. (2) Senior Assistant Resident Medical Officer at the Lake Hospital and Barnton House Annexe, Lytham (male unmarried), salary at the rate of £200 per annum.

LEEDS PUBLIC DISPENSARY.—Junior Resident Medical Officer. Salary £150 per annum.

LIVERPOOL AND DISTRICT HOSPITAL FOR DISEASES OF THE HEART.—House Physician. Salary £52 per annum.

LIVERPOOL STANLEY HOSPITAL.—(1) House Physician (2) House-Surgeon. Males. Salary at the rate of £100 per annum.

LONDON COUNTY COUNCIL.—Inspector of X Ray and other Electrical Treatment Apparatus in Hospitals, etc. Salary £450 a year rising to £600.

LONDON FEMALE LOCK HOSPITAL, 223 Harrow Road, W.9.—House Surgeon. Salary £150 per annum.

LONDON HOSPITAL, E.1.—(1) Medical First Assistant and Registrar (2) Surgical First Assistant and Registrar. Salary £400 per annum each.

LONDON LOCK HOSPITAL, 91 Dean Street, W.—(1) Surgical Registrar (2) Additional Surgical Registrar (3) House-Surgeon at Male Lock Hospital. Honorarium for (1) and (2) £100 for (3) £200 per annum.

LOWESTOFT AND NORTH SUFFOLK HOSPITAL.—Junior House-Surgeon (male). Salary £120 per annum.

MACCLESFIELD GENERAL INFIRMARY.—Resident House Surgeon. Salary £180 per annum.

MADRAS MEDICAL COLLEGE, Vizagapatam.—Professor of Pathology. Pay Rs.1,100 a month rising to Rs.1,600.

MANCHESTER ANCOATS HOSPITAL.—House-Surgeon (male). Salary £100 per annum.

MANCHESTER CITY.—Assistant Medical Officer at Baguley Sanatorium. Salary £350 per annum.

MANCHESTER ROYAL INFIRMARY.—Junior House-Surgeon and Casualty Officer (lady). Salary at the rate of £100 per annum for eight months rising to £200 per annum.

MANCHESTER ROYAL MANCHESTER CHILDREN'S HOSPITAL.—(1) Resident Medical Officer (2) Resident Surgical Officer (3) Two Assistant Medical Officers for Out-patients Department. Salary for (1) and (2) £125 per annum and for (3) £150 per annum.

MANCHESTER AND SALFORD HOSPITAL FOR DISEASES OF THE CHEST.—House Surgeon. Salary £100 per annum.

MANSFIELD AND DISTRICT HOSPITAL.—House-Surgeon and Casualty Officer (male). Salary £150 per annum.

MIDDLESEX COUNTY COUNCIL.—Resident Medical Officer (male) at Hillingdon Institution, Uxbridge. Salary £600 per annum.

MID-WALES COUNTIES MENTAL HOSPITAL, Talgarth, Brecon-shire.—Assistant Medical Officer. Salary £350 per annum, rising to £450.

MILLER GENERAL HOSPITAL, Greenwich Road, S.E.10.—(1) Casualty Officer (2) House-Physician (3) House-Surgeon. Salary for (1) £150 and for (2) and (3) £125 per annum.

NATIONAL HOSPITAL, Queen Square, W.C.1.—Resident Medical Officer. Salary £200 per annum.

NOTTINGHAM CHILDREN'S HOSPITAL.—Resident House-Surgeon (woman). Salary at the rate of £150 per annum.

OLDHAM ROYAL INFIRMARY.—Two House Surgeons. Salary £175 per annum.

PETERBOROUGH AND DISTRICT MEMORIAL HOSPITAL.—Second House Surgeon or House-Physician. Salary £145 per annum.

PLYMOUTH, SOUTH DEVON AND EAST CORNWALL HOSPITAL.—Assistant Pathologist. Salary £350 per annum.

PRESTON AND COUNTY OF LANCASTER ROYAL INFIRMARY.—House-Surgeon. Salary £150 per annum.

PRINCESS LOUISE KENSINGTON HOSPITAL FOR CHILDREN, W.10.—(1) House-Surgeon and Casualty Officer. Salary £75 per annum rising to £100 on appointment as Senior Resident. (2) Honorary Assistant Physician (male or female).

ROTHERHAM COUNTY BOROUGH.—Resident Assistant Medical Officer. Salary £150 per annum.

ROYAL DENTAL HOSPITAL OF LONDON, 32, Leicester Square, W.C.2.—Assistant Dental Surgeon.

ROYAL EYE HOSPITAL, St George's Circus, S.E.1.—(1) Twelve Salaried Refractionist (2) Twelve Clinical Assistant (3) Pathologist.

ROYAL NATIONAL ORTHOPAEDIC HOSPITAL, Great Portland Street, W.1.—House-Surgeon (male). Salary £150 per annum.

ROYAL NORTHERN HOSPITAL, Holloway, N.7.—(1) House Physician. (2) Resident Out-patient Casualty Officer and Anaesthetist. Salary in each case at the rate of £70 per annum.

RYDE ROYAL ISLE OF WIGHT COUNTY HOSPITAL.—(1) Member of Honorary Medical Staff (2) Resident House Surgeon, salary £120 per annum.

ST BARTHOLOMEW'S HOSPITAL, E.C.1.—(1) Assistant Surgeon to the Orthopaedic Department (2) Assistant Surgeon for Diseases of the Throat and Nose.

[The present issue being the Annual Educational Number, much current material is held over and neither the Supplement" nor the "Epitome of Current Medical Literature" is published this week.]

The British Medical Association:

ITS AIMS, WORK, AND CONSTITUTION

THE British Medical Association, as stated in our introductory article on the Profession of Medicine, was founded in 1832 to promote the medical and allied sciences, to maintain the honour and interests of the profession, and to foster a feeling of friendship among its members To attain these objects it holds periodical meetings for the discussion both of medical and scientific subjects and of professional affairs, it publishes the *British Medical Journal*, it maintains a reference and lending library, it has instituted lectures, and scholarships and grants for research It thus concerns itself with every side of medical work—science, clinical medicine, public health and the material interests of professional life The British Medical Association, with a membership now exceeding 35 000, is the oldest, largest, and most powerful British organization devoted to the welfare of the medical profession It has recently acquired a fine building in Tavistock Square, London, for its headquarters, providing ample accommodation for immediate needs and space for future developments These premises, designed by Sir Edwin Lutyens, R A, were formally opened in 1925 by His Majesty the King Patron of the Association and the beautiful wrought-iron gates erected as a memorial to the 574 members who fell in the war, by which the main quadrangle is completed, were dedicated on that occasion by the Archbishop of Canterbury The need for larger accommodation had become insistent owing to the remarkable growth in the central work of the Association during recent years, which had far outstripped the capacity of the premises in the Strand Further extensions to the building in Tavistock Square have now been completed

British Medical Association House Court of Honour

Constitution and Administration

The Association has Branches and Divisions throughout Great Britain and Ireland, and also in the Dominions, Colonies, and Dependencies The Divisions are arranged territorially, and number, in all, 252 For certain purposes of administration or of scientific and clinical work, the Divisions are combined into 97 Branches Members of Divisions elect representatives on the Branch Councils and also a member or members of the Representative Body, which is the governing body of the Association and determines its policy

The Council is the executive of the Association It is elected partly by the Divisions and Branches and partly by the Representative Body, and includes representatives of the Navy, Air Force, Army, and Indian Medical Services The Representative Body elected by the Representative Body The Representative Body and Council elect standing committees to take charge of different subjects Among these may be mentioned the Science, Medico-Political, Ethical, Hospitals, Public Health, and Naval and Military Committees There are Committees also for the Dominions, Scotland, Ireland, and Wales, and for the working machinery of the Association, such as the Organization, Finance, and Journal Committees The Insurance Acts Committee, elected partly by the Association and partly by insurance medical practitioners, is financed by the Association, it is the recognized executive and mouthpiece of the insurance practitioners of Great Britain

Privileges of Members

A member of the Association has the right—

1 To attend the annual and other general meetings of the Association and the meetings of the Division and Branch to which he or she belongs

2 To take part by personal vote (or in some Divisions by voting paper) in the election of the representative of his or her Division in the Representative Body, and also in the election of members of the Council

3 To receive by post the *British Medical Journal*, published weekly, which gives a full record, with commentary, of progress in clinical and scientific medicine and of medico-political affairs throughout the British Empire

4 To receive the help and advice of the central office in any professional difficulty

5 To use the Library as a reading room, and to borrow current medical or scientific books on payment of postage Besides modern works and periodical medical literature—foreign as well as English—the library contains many books of historic interest

The full benefits of the Association can only be secured by the co-operation of large numbers of the medical profession, for the greater the membership and the funds the more efficient and influential the organization The Association during the past ninety-seven years has been the direct means of benefiting every class of medical men and medical women In asking for new members it looks not only to the older practitioners but also and especially to those recently qualified To these a generous concession is made as regards subscription, and there is a special claim to their recognition of the work of the Association in improving the conditions under which they may hold appointments in the public services or in civil life The Association's work for the Services is well known It feels a special responsibility towards those members of the profession who by reason of their position are precluded from taking common action, and recent events have proved again its capacity to further their interests

Subscriptions and Applications for Membership

The ordinary subscription to the British Medical Association is 3 guineas a year for members resident in the British Isles, but this is subject to various exceptions Thus, newly qualified practitioners elected within two years of registration pay half this sum up to the end of the fourth year after registration, medical officers on the active list of the R N, R A F, R A M C (Regular), and I M S pay 2 guineas, concessions are made also to members (in the British Isles) of forty years' standing, to members of ten years' standing who have retired from practice, to medical married couples residing together, and to whole-time teachers and research workers The ordinary subscription for members living abroad is 1½ guineas, but some Branches have special local subscriptions A member elected after June 30th pays half the subscription for that year

All duly qualified British medical practitioners are eligible for election Full particulars can be obtained from the Medical Secretary, British Medical Association House, Tavistock Square, London, W C 1, the Scottish Medical Secretary, 7, Drumsheugh Gardens, Edinburgh, or the Irish Medical Secretary, 16, South Frederick Street Dublin

THE RATIONALE OF THE ACTION OF RYVITA CRISPBREAD IN CERTAIN SPECIAL CONDITIONS

ANAEMIA AND NEURASTHENIA

Besides being a nourishing easily digestible and laxative food Ryvita is rich in organic Iron—the only form of iron compounds which can be utilised by the blood. Ryvita is therefore a useful item in the treatment of Anaemia

Ryvita is a great aid in all neurasthenic conditions when a nourishing and at the same time easily digestible and assimilable diet is so important Ryvita is also a rich source of the nerve-nourishing vitamin—B and of the nerve nourishing salts of phosphorus

Ryvita is made of pure crushed wholegrain rye. It is balanced by its own B Vitamin since the structure of rye grain prevents the germ being lost in the milling, as it so often is from wheat or oats Ryvita is rich in the natural organic salts of iron, phosphorus and lime

Ryvita is definitely indicated as an item of the dietary in treatment of disorders arising from digestion constipation or malnutrition It is usual to suggest that the patient begin by eating two or three slices of Ryvita with at least one meal each day

RYVITA

CRISPBREAD

We shall be very pleased to send Free Samples and full particulars to any interested Member of the Profession.

THE POSTAL ACCOUNT

It is often supposed that to live a long way from the nearest branch of a bank, or to be constantly unable to go to the bank in person, is a handicap to the enjoyment of the full advantages which, it is admitted, a banking account offers Perhaps it is assumed that to conduct an account by post involves 'more letter writing', or is costly or is not welcomed by the Bank It is the aim of the Westminster Bank to dispel such misconceptions by a leaflet entitled *The Postal Account*, which explains the convenience of the method, and offers some clear suggestions

The Secretary of the Bank will be pleased to send a copy on application

For further particulars apply to the Dean.

J E. M. WIGLEY MB Dean.

KING'S COLLEGE HOSPITAL MEDICAL SCHOOL

(UNIVERSITY OF LONDON)

Dean H WILLOUGHBY LYLE, M D, B S Lond, F R C S, J P

The present HOSPITAL was opened in 1913 and is one of the best equipped Hospitals in England It is planned for 600 beds but at present, owing to lack of funds, 200 are not available It serves a population of nearly 2 000 000, and the attendances in the Casualty and Out patient Departments during the year 1929 amounted to 283,136

The MEDICAL SCHOOL Buildings, like those of the Hospital are up to date and exceptionally fine The Laboratory and Pathological Department and the Post-mortem Room are especially noteworthy

In the Education at the Hospital a special feature has always been the individual *attention given to each* Student, and each subject is taught by *its own specialist* *There is ample opportunity for any* Student who wishes to specialize in a subject to continue his studies with the help of Junior Staff appointments With a view to ensuring co ordination of studies, the teaching of each of the subjects of Medicine, Surgery, and Gynaecology has been placed in charge of a member of the Senior Honorary Staff assisted by Medical Surgical, and Obstetric Tutors Attached to the Gynæcological Department is a Maternity Ward, through which Students can qualify for the requirements in that subject of all the Examining Bodies

FOURTEEN ENTRANCE SCHOLARSHIPS, of a total value of £1,530 are awarded annually

"The PLATANES," close to the Hospital, with large grounds and tennis courts, is a residence for 80 Students

The ATHLETIC GROUND (over six acres in extent) is within ten minutes' walk of the Hospital

The Fee for the advanced studies is 93 guineas The Entrance Fee of 10 guineas includes membership of the Clubs and Societies Union

DENTAL SCHOOL The Dental School was opened in October, 1923 A full course is given in co operation with King's College, in preparation for Dental Degrees and Diplomas

For Particulars, Calendar of the School, and Appointments to see the School and Hospital, application should be made to the Secretary, S C Ranner, M A Cantab, King's College Hospital Medical School, Denmark Hill, London, S E 5

ST. GEORGE'S HOSPITAL MEDICAL SCHOOL

(UNIVERSITY OF LONDON)

HYDE PARK CORNER, S.W.

THE *HOSPITAL and MEDICAL SCHOOL occupy* the finest site in London and are readily accessible from all parts of the Metropolis

The entire teaching in the School is devoted to the subjects of the Final Examinations, in other words, is specially adapted to the interests of men from the Universities who have passed their Examination in Anatomy and Physiology

By arrangement with the authorities of King s College in the Strand, St George's Students attend at that College for tuition in the Preliminary and Intermediate subjects

SEVEN ENTRANCE SCHOLARSHIPS IN ANATOMY AND PHYSIOLOGY, AND GENERAL PATHOLOGY, of the value of £120, £80 (3), £50 and £40 (2) respectively, are awarded in July to candidates who have passed the *2nd M B or corresponding examination* In addition, EXHIBITIONS, each of the value of £40 and up to *Four in* number, will be awarded to candidates of approved merit in the Entrance Scholarship Examination

MANY VALUABLE PRIZES ARE AWARDED EACH YEAR, including the following —Allingham Scholarship of the value of £87 Laking Memorial Prize of the value of £65 the Brackenbury Prize in Medicine, the Brackenbury prize in Surgery, and the Webb Prize in Bacteriology, each of the value of £—

RESIDENT APPOINTMENTS may be held for four, eight, or twelve months A Student of ordinary ability should have an excellent chance of *obtaining* these posts and afterwards one of the following Paid appointments for a short time Resident Assistant Physician, £250, Resident Assistant Surgeon, £250 Medical Registrar, £200 Surgical Registrar, £200, Assistant Curator of the Museum, £100, Resident *Anæsthetist*, £100, Resident Obstetric Assistant, £100

The ST GEORGE'S HOSPITAL CLUB incorporates the RUGBY FOOTBALL, CRICKET, LAWN TENNIS, BOXING, RIFLE and other Clubs, and possesses an ATHLETIC GROUND within easy reach of the Hospital, and Smoking and Luncheon Rooms on the School Premises

Entrance Fee, £10 10s 0d Annual Composition Fee which covers all courses, lectures, etc, in the Hospital and School, £42 *Annual Club Subscription*, £3 3s 0d

The Winter Session will begin on October 1st, but students can enter at any time

Further information may be obtained from the Dean of the Medical School

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL

(UNIVERSITY OF LONDON)

THE WINTER SESSION BEGINS on WEDNESDAY, OCTOBER 1st, 1930

SITE.—The Hospital occupies the finest open site in London, facing the River and the Houses of Parliament.

SCIENCE, ANATOMY, AND PHYSIOLOGY.—Classes and Lectures in all Elementary and Intermediate subjects provide complete instruction for the University and the Conjoint Board Examinations.

CLINICAL WORK.—The facilities for Clinical work are second to none in London. Clerks and Dressers, who work under the immediate supervision of the Staff, are appointed every three months in all General and Special Departments of the Hospital.

SPECIAL DEPARTMENTS.—The Special Departments in the Hospital provide Clinical Instruction in all Special subjects.

In connection with the DEPARTMENT OF OBSTETRICS AND GYNÆCOLOGY all Students attend the practice of the MATERNITY WARD before proceeding to work in the district.

THE PRIMARY F.R.C.S. CLASSES will commence on Tuesday, September 9th.

THE FINAL F.R.C.S. COURSE will commence during the second week in October.

ENTRANCE SCHOLARSHIPS.—One in Arts, free course for first 2 years of Study. Two in Science (Pre-Sci. Standard) £150 and £60. Two for University Students (Anatomy, Physiology, Pathology, Applied Chemistry, any two subjects) £100 and £25.

ST. THOMAS'S HOUSE.—A residential Club for Students has recently been opened, providing accommodation for some 60 resident Students, and including spacious Club rooms, etc. The SPORTS GROUND is within easy reach of the Hospital.

ANNUAL FEE.—£50 for each Year of Study. The Annual Fee covers the cost of all Lectures, Classes, etc., except the following: "Fevers, £3 3s. 0d.

AMALGAMATED CLUBS. Entrance Fee £2 2s. 0d., Annual Subscription £5 5s. 0d.

Full particulars may be had by application to

R. J. C. THOMPSON, C.M.G., D.S.O., M.D. Durh., M.R.C.P. Lond.,
Medical Secretary to the School, St. Thomas's Hospital, Lambeth Palace Road, S.E.1.
Professor L. S. DUDGEON, C.M.G., C.B.E., F.R.C.P. Lond., Dean.

UNIVERSITY OF LONDON

OPHTHALMIC HOSPITAL MEDICAL SCHOOL.

ROYAL LONDON OPHTHALMIC HOSPITAL

(Moorfields Eye Hospital), CITY ROAD, E.C.1

Qualified Medical Practitioners and Registered Medical Students may enter on the Practice of the Royal London Ophthalmic Hospital (Moorfields) at any time, and are, on certain conditions, eligible for appointment as Chief Clinical Assistant, Clinical Assistant and Junior Assistant.

Courses of Instruction, extending over a period of five months, begin in OCTOBER and MARCH

1. Practical Refraction Classes.
2. Methods of examination and use of the ophthalmoscope.
3. Lectures every afternoon on the following subjects: (*a*) Anatomy, including Embryology and Normal Histology, (*b*) Physiology, (*c*) Optics, including Physiological Optics, (*d*) Pathology and Bacteriology, (*e*) Ophthalmic Medicine and Surgery, consisting of Medical Ophthalmology, External Diseases of the Eye, Motor Anomalies and Squint, Diseases of the Retina and Optic Nerve, Diseases of the Uveal Tract.
4. Ophthalmoscopic Conditions: a practical class with demonstrations each week at 5 p.m.
5. Clinical Lectures.
6. Occasional Lectures on subjects allied to Ophthalmology.
7. Operative Surgery. In these classes the usual operations are performed by the student upon pigs' eyes.
8. Practical Pathology. A course of demonstrations on the normal and morbid histology of the eye is given by the pathologist in the laboratory.
9. Practical Bacteriology.
10. Classes in Radiography.
11. Physico-therapy (Ultra-violet Light, Diathermy, etc.).
12. Slit-lamp Microscopy.

FEES.—A composition fee of 35 guineas will admit Students once to all the lectures and classes (except the classes on Physico-Therapy, and Slit-lamp Microscopy, and the examination fee).

DIPLOMA IN OPHTHALMIC MEDICINE & SURGERY & OTHER DEGREES IN OPHTHALMOLOGY

The above complete curriculum is specially designed to meet the requirements of candidates entering for these examinations.

Fees for the Practice of the Hospital:

Perpetual	£5 5 0	Two months	£2 2 0
Three to six months	£3 3 0	One month	£1 1 0

Clinical work begins at 9 a.m. daily. Operations are performed between 10 a.m. and 1 p.m.

For further particulars apply to the SECRETARY to the Medical School at the Royal London Ophthalmic Hospital, City Road, E.C.1, or to the Dean, CHARLES GOULDEN, O.B.E., M.D., M.Ch., F.R.C.S.

THE MIDDLESEX HOSPITAL MEDICAL SCHOOL

UNIVERSITY OF LONDON

WINTER SESSION BEGINS ON OCTOBER 1st

The entire Medical Curriculum can be taken at this School There is no accommodation for Women Students Annual value of Scholarships and Prizes £1,000 Large Research Funds

STAFF INCLUDES 6 UNIVERSITY PROFESSORS 2 UNIVERSITY READERS 29 LECTURERS 8 DEMONSTRATORS and 4 TUTORS

ENTIRE CURRICULUM—THE PROVISION WHEREBY ALL THE SUBJECTS OF THE CURRICULUM INCLUDING CHEMISTRY PHYSICS AND BIOLOGY FOR THE PRE MEDICAL EXAMINATION ARE TAUGHT WITHIN THE PRECINCTS of the HOSPITAL and MEDICAL SCHOOL and every effort made to encourage co-ordination ensures that the student instead of proceeding to the study of the various subjects as if they were isolated and having little or no relation to each other is taught each subject by professors and lecturers who are instructing medical students only and are in close touch with all the other departments of the School The rebuilding of the Hospital and completion of new buildings in connection with the Medical School have now reached such a point that those working in the Institution have facilities equal to or superior to those to be found in any other hospital in the United Kingdom and the rapid progress which is being made with the remaining buildings promises even greater facilities in the immediate future The new buildings are not confined to the wards but include a magnificent Nurses Home a new Out-patients Department the Institute of Biochemistry and new departments of Neurology Dermatology etc The following description of the work in various departments is designed to show how co-ordination is carried out

CHEMISTRY is taught by Professor W B Tuck and the class room and laboratories are in the immediate vicinity of those for anatomy physiology pharmacology pathology and bacteriology This leads to a close association with these departments and the student realises how interesting and practical chemistry which he requires for his first professional examination but is acquiring knowledge which he will need and have to apply in later years Professor Tuck also gives instructions in Toxicology and in the Chemistry required by candidates for the DIPLOMAS IN PUBLIC HEALTH so he is in touch with students in their final years and also in their post graduate studies

THE PHYSICS DEPARTMENT is under the charge of Professor Sidney Russ who is also Physicist to the Hospital and engaged *in research work on the measurements and dosage of X-ray and* Radium emanation He is therefore in close touch with the departments of physiology and pathology and takes an active part in departments for clinical therapeutics Under his direction the student will realise at once that he is not studying an isolated subject for the purpose of training his mind or simply to comply with regulations and pass an examination but is in touch with a subject which will be of great and increasing importance in the proper understanding of his work in later years

BIOLOGY—The Lecturer on Biology is Dr J H Woodger who holds a University Readership in this subject His teaching in biology is characterized by co-ordination with other departments and the bearing of the subject on the later stages of the curriculum is emphasized. Not only is the subject taught as an introduction to the study of Anatomy and Physiology but the increasing importance of a knowledge of the lower forms of vegetable life and of the protozoa in the causation of disease and the study of insect carriers of human diseases is emphasized by co-ordination with the Pathological Institute.

IN THE DEPARTMENT OF ANATOMY, under the direction of Professor Thomas Yeates with the general scientific study of Anatomy and its wider Biological aspect the relation of structure to function and pathology is not lost sight of Facts of clinical medicine and surgery of pathology biology and physiology are included in the teaching in order to emphasize the significance of anatomical points By classes in Applied Medical and Surgical Anatomy the study of this subject is continued in the later stages of the student's career

THE TEACHING OF PHYSIOLOGY is in the hands of Professor *Samson Wright and the department is in close touch with those* for the teaching of both the preliminary and final subjects of the curriculum It is impressed upon the student in this department that he cannot be a good clinician unless he obtains a sound knowledge of Physiology Later in his career the student has continuous opportunities of applying what he has learnt in the Physiological department and his physiological knowledge is further extended notably in the study of PHARMACOLOGY and in the CARDIOGRAPHIC Department where he has opportunities of studying the electrical conditions of the heart both in health and disease

IN THE BLAND SUTTON INSTITUTE OF PATHOLOGY all the departments of the Medical School are brought in touch. Here the student learns the SCIENCE OF DISEASE. The teaching of Pathology is in the hands of Professor J McIntosh and under his tuition the student is made to realise that *Pathology and Medicine* are one and that a clear knowledge of Pathology and Bacteriology is essential for the prevention diagnosis and treatment of disease The teaching of pathology is brought into the closest touch with clinical teaching and the student sees the practical application of the sciences in which he has been instructed in the earlier years of the curriculum—chemistry physics biology anatomy and physiology

THE COURTAULD INSTITUTE OF BIOCHEMISTRY is a new building fully equipped with laboratories for teaching and biochemical research. Professor E C Dodd who is in charge of the Department holds complete courses in *Biochemistry for students* both in their early years and during their period of instruction in the ward In addition to this the student here acquires constant practical experience of the important modern chemical investigations necessary for the detection of disease and the study of its evolution Several valuable post-graduate appointments in this Institute become available to students showing special ability in this direction

CLINICAL TEACHING is carried out in the general wards and out patients departments and in the special departments all of which are in close touch with the scientific departments in the School The student has ample opportunities for carrying out the physical examination of patients and with his training on the scientific side combines *instruction in the art of Medicine* by constantly being brought in contact with patients and being made to realise the human side of his professional work In order that the student may have ample bedside teaching and opportunities for carrying out the examination of patients himself the number of students allowed at a Clinique *is limited.*

There are ample clinical appointments for all students and twenty five Resident appointments are open annually to students of the School who have obtained their degrees or diplomas

THE SOCIAL AND ATHLETIC side of the student's life has been arranged for There are large athletic grounds with new Pavilion restaurant and gymnasium Common Room Society Medical Society Musical Society and various other Clubs The beautiful swimming bath in the new Nurses Home is available for students on certain days weekly

Write for Prospectus to the DEAN T IZOD BENNETT M.D B.S F.R.C.P Middlesex Hospital Medical School Berners Street London W.1

London School of Hygiene and Tropical Medicine.

(University of London)

TROPICAL MEDICINE AND HYGIENE

The School provides two courses yearly, each of twenty-two weeks The Autumn course commences on 30th September, 1930, and the Spring course on 2nd February, 1931 Composition Fee, to include hire of Microscope, &c, £34 5s

DIPLOMA IN PUBLIC HEALTH

The next Course of Study, covering a period of Twelve Months, commences on 29th September, 1930, and is so designed that students wishing to do so can proceed to the new academic diploma instituted by the University of London
The Composition Fee of 54 Guineas covers the cost of the necessary practical work and instruction in infectious diseases, &c

DIPLOMA IN BACTERIOLOGY

The Course of Study, covering One academic Year, commences early in October Composition Fee, £47 15s

THE UNIVERSITY OF LIVERPOOL.

FACULTY OF MEDICINE.

THE MEDICAL SCHOOL provides complete courses of instruction for the Examinations of the University of Liverpool, and also meets the requirements of other Universities and Examining Bodies in the United Kingdom

Other Schools of the Faculty are —The School of Dental Surgery, the School of Hygiene, the School of Tropical Medicine, and the School of Veterinary Science

DEGREES AND DIPLOMAS IN THE FACULTY OF MEDICINE

Bachelor of Medicine & Bachelor of Surgery	M B, Ch B	Master of Veterinary Science	M V Sc
Doctor of Medicine	M D	Doctor of Veterinary Science	D V Sc
Master of Surgery	Ch M	Doctorate in Philosophy	Ph D
Master of Hygiene	M H	Licence in Dental Surgery	L D S
Master of Orthopædic Surgery	M Ch Orth	Diploma in Public Health	D P H
Bachelor of Dental Surgery	B D S	Diploma in Tropical Medicine	D T M
Master of Dental Surgery	M D S	Diploma in Tropical Hygiene	D T H
Bachelor of Veterinary Science	B V Sc	Diploma in Veterinary Hygiene	D V H
		Diploma in Medical Radiology & Electrology	D M R E

Valuable Fellowships, Scholarships, and Prizes are offered for competition each year

THE CLINICAL SCHOOL consists of FOUR GENERAL HOSPITALS The Royal Infirmary, the Royal Southern Hospital, the David Lewis Northern Hospital, and the Stanley Hospital, and of FIVE SPECIAL HOSPITALS The Eye and Ear Infirmary, the Hospital for Women (including the Samaritan Hospital), the Royal Liverpool Children's Hospital, the Liverpool Maternity Hospital, and the St Paul's Eye Hospital

These Hospitals contain in all about 1,500 Beds

The organization of these Hospitals to form one teaching Institution provides the Medical Student and Medical Practitioner with a field for clinical education and study which is unrivalled in extent in the United Kingdom

Infectious Diseases are studied in the Local and District Hospitals, and Mental Diseases at the County Mental Hospital, Rainhill

For information on all matters concerning the curriculum application should be made to the Dean of the Faculty of Medicine the University of Liverpool

W J DILLING, Dean

THE CLINICAL SCHOOL,

UNIVERSITY OF LIVERPOOL.

The following Hospitals are associated for purposes of Clinical Instruction and form the Clinical School of the University —

THE ROYAL INFIRMARY	**THE STANLEY HOSPITAL**	**THE HOSPITAL FOR WOMEN** (including the SAMARITAN HOSPITAL)
THE ROYAL SOUTHERN HOSPITAL	**THE EYE AND EAR INFIRMARY**	**LIVERPOOL MATERNITY HOSPITAL**
THE DAVID LEWIS NORTHERN HOSPITAL	**ROYAL LIVERPOOL CHILDREN'S HOSPITAL**	**ST PAUL'S EYE HOSPITAL**

The Staffs of these Hospitals form the Teaching Staff of the Clinical School There are over 1,500 beds in the Associated Hospitals affording a field for Clinical Instruction which is unrivalled in the United Kingdom

Twenty one house physicians and house surgeons are appointed every six months in the General Hospitals, and the majority of these receive salaries ranging from £60 to £100 per annum Five resident medical officers are also appointed at intervals to the Special Hospitals

Information regarding the regulations for Hospital Practice may be obtained from the Secretary of the School,
J C MATTHEWS M A M D F R C P 61 RODNEY STREET

UNIVERSITY OF BRISTOL.

FACULTY OF MEDICINE

The WINTER SESSION commences on 3rd October, 1930

The University grants the Degrees of Bachelor of Medicine and Surgery (M B Ch B) Master of Surgery (Ch M) Doctor of Medicine (M D) Bachelor of Dental Surgery (B D S), and Master of Dental Surgery (M D S), as well as diplomas in Public Health (D P H) and Dental Surgery (L D S)

The lectures and laboratory courses which are given in the University although primarily designed for the degrees and diplomas of the University are equally adapted to those of other Universities and Examining Boards, and Students preparing for such external degrees and diplomas have equal attention paid to them

Hospital Practice and Clinical Instruction are provided in the Hospitals and Asylum of the City associated with the University for this purpose and Students have exceptional opportunities of studying the practice of medicine from a large variety of cases

Women are admitted to all Classes, Lectures and Laboratory Practice, and attend them with men The Halls of Residence for Men and for Women Students are situated in Clifton, near the University

INCLUSIVE FEES—

For the M B, Ch B curriculum	205 guineas
For the B D S curriculum, including Mechanical Laboratory	215 ,,
Do excluding Mechanical Laboratory	155 ,,
For the L D S curriculum, including Mechanical Laboratory	200 ,,
Do excluding Mechanical Laboratory	140 ,,
For Mechanical Laboratory alone	60

UNIVERSITY OF DURHAM

COLLEGE OF MEDICINE,

NEWCASTLE-UPON-TYNE.

The degrees in Medicine Surgery Hygiene and Dentistry the Diploma in Public Health, the Diploma in Psychiatry and the Licence in Dental Surgery of the University of Durham are open to men and women

The WINTER SESSION, 1930-31, will be commenced on WEDNESDAY, OCTOBER 1st

Students can complete at the University of Durham College of Medicine, Newcastle-upon-Tyne the entire course of professional study required for the above degrees diplomas, and licence also for the Examinations of the Royal Colleges of Physicians and Surgeons and other Examining Bodies

Hospital practice is carried out at the Royal Victoria Infirmary a general hospital containing more than 550 beds and there are facilities for the study of the various special subjects General and Special Post-Graduate Courses are held

Practical Midwifery can be studied at the Princess Mary Maternity Hospital which contains 90 beds with an annual indoor and outdoor attendance on 3 000 cases Lectures are given on Psychological Medicine in the College of Medicine and clinical instruction at the Mental Hospital Newcastle Special Courses of Instruction in Outdoor Sanitary Practice and in the Hospital for Infectious Diseases are given by the City Medical Officer of Health

Particulars may be obtained from the DEAN of the College

THE UNIVERSITY OF SHEFFIELD.

Vice Chancellor W W PICKARD CAMBRIDGE M A D Litt.

FACULTY OF MEDICINE

Dean Professor J S C DOUGLAS M A D M B Ch M Sc

The University grants Degrees in Medicine (M B Ch B M D Ch M) and in Dental Surgery (B D S M D S) It also grants a Diploma in Dental Surgery (L D S) These are all open to men and women on equal terms

The session 1930 1931 begins on October 1st.

Lectures and laboratory courses are given in the University whilst clinical instruction is provided in the general and special Hospitals in the City

Although the teaching is primarily directed towards the requirements of the University the instruction amply covers those of other examining bodies

A number of resident hospital appointments are open to qualified students of the school

Halls of Residence—There are four Halls of Residence one for men students and three for women students

Scholarships—A number of Entrance Scholarships are open to students wishing to enter the Faculty of Medicine There are also post graduate scholarships

A prospectus of the School containing all necessary details and also particulars of scholarships may be obtained free from— W M GIBBONS Registrar

UNIVERSITY OF BIRMINGHAM

FACULTY OF MEDICINE

(Associated with the General Queen's and Special Hospitals for Clinical Teaching)

THE SESSION OPENS ON OCTOBER 6th 1930

The University grants Degrees in Medicine Surgery and Public Health and a Diploma in Public Health also Degrees and a Diploma in Dental Surgery

The courses of instruction are also adapted to meet the requirements of other Universities and Licensing Bodies.

HOSPITAL APPOINTMENTS

A large number of Resident Hospital appointments in Birmingham and District are open to qualified students of the School.

SCHOLARSHIPS EXHIBITIONS AND PRIZES

Entrance and other Scholarships and Exhibitions and various Prizes and Medals are awarded annually in the Faculty of Medicine

SCHOOL OF DENTISTRY (University of Birmingham and Birmingham Dental Hospital)

The School of Dentistry in conjunction with the General and Queen's Hospitals affords a complete curriculum for the Dental Diplomas and Dental Degrees of the University and all other Licensing Bodies A Dental Scholarship of the value of £40 1st. ed. is offered annually

PRE MEDICAL AND PRE DENTAL EXAMINATIONS

The necessary Courses of Instruction in Chemistry and Physics and in Biology may be attended in the University

RESIDENCE FOR UNDERGRADUATES AND OTHER STUDENTS

There are Halls of Residence for Men and for Women Students. A register of approved lodgings is also kept by the Secretary of the University

For Syllabus and further information apply to Prof J C BRASH M A M D Dean

UNIVERSITY OF MANCHESTER.

FACULTY OF MEDICINE

The WINTER SESSION commences on OCTOBER 2nd

The Laboratories and Museums afford every facility to Students and Graduates for Practical Instruction, as well as for Original Research

SCOPE OF INSTRUCTION

Complete Courses of Instruction are offered for the Examinations of the University of Manchester, and also for the Examinations of other Examining Bodies in the United Kingdom Post-Graduate Courses are held in preparation for the Diploma in Psychological Medicine (Manch), the Certificate in Venereal Diseases, and in various branches of Medicine and Surgery In the Dental Department Complete Courses are given preparing for the Degrees and Diploma in Dentistry granted by the University, as well as for the Diploma of the Royal College of Surgeons of England, and other Dental Diplomas The Public Health Laboratories are situated at a short distance from the University The fullest opportunities are offered to Graduates and others in preparation for the Diplomas in Bacteriology, in Public Health, and in Veterinary State Medicine, and for Special Certificates in School Hygiene and Factory Hygiene Particulars may be obtained from the Dean of the Medical School

OPPORTUNITIES FOR CLINICAL STUDY—ROYAL INFIRMARY AND OTHER HOSPITALS

The Clinical Instruction is given in the new Royal Infirmary, opened in 1909 on a site near to the Medical School It is provided with every modern requirement for the treatment of the sick and the investigation of disease Instruction in Special Subjects is given in other Hospitals associated with the University A large number of beds in the General and in the Special Hospitals are available, thus affording unrivalled opportunities for Clinical Study

1 The Manchester Royal Infirmary	614 beds	6 Fever Hospital for Infectious Diseases	600 beds
2 The St Mary's Hospitals for Women and Children	216 beds	7 Special Hospitals for Diseases of the Ear Throat and Chest, Skin and the Christie Cancer Hospital	265 beds
3 Manchester Children's Hospital	190 beds	8 Dental Hospital for Manchester	
4 Manchester Royal Eye Hospital	150 beds	9 Ancoats Hospital	136 beds
5 Manchester Northern Hospital for Women and Children	73 beds	10 Salford Royal Hospital	265 beds

HOSPITAL APPOINTMENTS

In consequence of the large number of Hospitals associated with, or in the vicinity of, the University, exceptional opportunities are offered to Graduates to obtain Resident Hospital Appointments

SCHOLARSHIPS, EXHIBITIONS, AND PRIZES

Two Open Entrance Scholarships for Graduates, each of the value of 160 guineas, are offered yearly in July In addition, the Dreschfeld Scholarship of £30 per annum, the John Russell Medical Entrance Scholarship of £45 per annum, and other Entrance Scholarships of the value of £30 to £40 a year for two or three years, are also tenable in the Medical Faculty

Fellowships, Scholarships, etc , are also offered for competition to Students of the Faculty

RESIDENCE FOR UNDERGRADUATES

There are Halls of Residence both for Men and for Women Students A list of registered lodgings can be obtained Prospectuses will be forwarded on application to the Registrar

MANCHESTER UNIVERSITY MEDICAL SCHOOL

POST-GRADUATE COURSES IN MEDICINE AND SURGERY.

The following arrangements have been made for Post-Graduate teaching in Manchester during 1930-31

1. **ANCOATS HOSPITAL:**
   A Post-Graduate Day on Thursdays during the University terms Syllabus available at the beginning of October No fee charged
2. **PART-TIME COURSES**
   (a) **In Ophthalmology (Royal Eye Hospital)**—October 7th to November 20th, 1930, Tuesdays and Thursdays Fee £3 3s
   (b) **In Diseases of the Skin (Skin Hospital, Quay Street),**—February 9th to 21st, 1931 Twelve Clinical Demonstrations Fee £3 3s
   (c) **In Practical Instruction in Local Anaesthesia and Minor Operative Surgery (Salford Royal Hospital)**—Wednesdays, October 8th to November 26th, 1930 Fee £3 3s
   (d) **In Bacteriology and Immunity (Public Health Laboratory, York Place)**—Wednesdays and Fridays, Michaelmas and Lent terms Fee £10 10s
3. **CLINICAL ASSISTANTSHIPS**—Maximum fee £4 4s
4. **RADIUM THERAPY**—Clinical Assistantships at the Manchester and District Radium Institute, one day per week, for three months Fee £4 4s

Syllabus and other information may be had on application to the Dean of the Medical School

THE UNIVERSITY OF LEEDS

FACULTY OF MEDICINE

SCHOOL of MEDICINE and THE GENERAL INFIRMARY at LEEDS

The First Term begins on **October 1st, 1930**

The degrees of M B , Ch.B , Ch M and M D are conferred, and diplomas in Public Health and Psychological Medicine are granted by the University

The systematic Classes and Lectures are held in the School of Medicine of the University while the Clinical instruction is given in the General Infirmary The combined courses of study are arranged to meet the University Regulations in the first instance, but they also afford every opportunity for students preparing for the examinations of any licensing body

The instruction in the subjects for the First Examination is given in the Department of Science of the University

The Composition Fee for the Academic Courses and Clinical instruction is £242.

For further particulars application should be made —

Regarding instruction given at the University to
The Academic Sub-Dean,
School of Medicine,
Leeds

Regarding instruction given at the Infirmary to
The Clinical Sub-Dean,
General Infirmary,
Leeds

THE UNIVERSITY OF LEEDS

SCHOOL OF DENTISTRY

The First Term begins on **October 1st, 1930**

The degrees of B Ch D and M Ch D , as well as a diploma, L D S , are conferred by the University

The systematic Classes and Lectures are held in the School of Medicine and School of Dentistry of the University, while the clinical instruction is given in the Leeds General Infirmary and School of Dentistry The combined courses of study are arranged to meet the University Regulations in the first instance, but they also afford every opportunity for study to students preparing for any of the dental examinations

Intending students can enter as pupils in the Dental School and can obtain instruction in the preliminary scientific subjects in the Department of Science of the University

For further particulars application should be made —

Regarding instruction given at the University to
The Academic Sub Dean,
School of Medicine,
Leeds

Regarding clinical instruction
The Warden,
School of Dentistry Leeds

21 WEST MIDLANDS.—Very old-established mixed-class PRACTICE in small town (largely residential) amid agricultural district of exceptional beauty. Cash receipts at present £2,367 p.a. with panel of over 1,000. Opposition not strong. Very fine house (3 reception 6 bedroom bathroom etc.) standing in nearly 3 acres of ground. Beautiful garden tennis lawn and productive orchard. Price freehold £2,000. Premium 1½ year purchase.

22 BORDERS OF BEDFS AND HANTS.—In a delightful district an old established mixed-class PRACTICE averaging for the past three years £904 p.a. (last year £973) including panel of 400. Visits 5/ to 12/6 medicine extra (3/6). One opponent. House contains ample accommodation (2 sitting rooms 7 bedrooms bathroom etc.) Large garden and garage. Rent £90 p.a. Prem. £140. Excellent sport.

23 YORKSHIRE.—GOOD TOWN.—PARTNERSHIP.—A one-half share (guaranteed to produce £2,000 p.a. in first year) is offered in a good middle-class PRACTICE. In order for the immediate part twelve months approximately £4,000. Small selected panel of 430. One appointment worth nearly £650 p.a. Fees 3/6 upwards. Opposition not strong. Suitable house can be bought or leased. Very good educational and sporting facilities. Premium 2 years purchase.

24 NEAR HEREFORDSHIRE BORDER.—HOSPITAL TOWN.—Old-established mainly good-class non-dispensing PRACTICE, averaging about £1,200 p.a. Panel of 500-600. Fees 5/ to 10/6. The house in centre of town. Price for freehold £1,200 part on mortgage. Premium £1,800, £1,300 down and balance by instalments. Up-to-date Cottage Hospital and good scope for surgery.

25 YORKS.—PARTNERSHIP.—Within a few miles of large residential town the half share of old-established unopposed country PRACTICE owing to retirement of senior partner through age and ill-health. Cash receipts for past three years averaging over £2,500 p.a. including appointments and panel of 1,200. Very little midwifery. Railway station. Good house available with large garden. Electric light and water laid on. Price freehold £1,200 part on mortgage. Premium 2 years purchase.

26 PARTNERSHIP.—COUNTY TOWN within 150 miles North of London.—A one-fifth share is offered in a very old-established good middle-class Practice having good scope. Gross cash receipts for past twelve months nearly £6,000 including panel of 3,400. Fees 2/6 to 21/. Not much midwifery. Suitable house available at present rental of £52 per annum. Premium £2,000 (£1,200 can remain on mortgage). Present partner retiring.

27 WEST OF ENGLAND.—In a small pleasant town and district of beautiful surrounding country old-established PRACTICE. Income nearly £1,350 p.a. including panel of 900. Visits 2/6 to 21/. Little midwifery. Very attractive house containing 2 reception 3 large professional rooms, private entrance, 2 reception 5 bedrooms bathroom etc. Very good garage and stabling. Premium £2,000 (£1,200 can remain on mortgage). Price £2,400. Good reason etc.

28 LANCS.—Pleasant Town near Coast.—Well-established middle and better-class PRACTICE. Cash receipts last year over £900 including panel of 820. Visits 3/6 to 5/6 medicine extra 2 to 10 gns. (about 20 cases). Suitable house with 2 reception 4 bedrooms etc. Price for leasehold £1,100 £600 on mortgage. Premium 1½ years purchase part by instalments.

29. GLOS.—COUNTRY PRACTICE.—Old-established PRACTICE in picturesque surroundings averaging about £1,250 p.a. including panel of over 1,100. Visits from 3/6. Commodious house with reception 6 bedrooms, etc. Garden. Garage. Price £1,500 £1,000 on mortgage. Premium £1,950.

Full Schedule of Terms and Conditions will be forwarded on application.

Measuring Progress by the Therapeutic Yardstick

ANCIENT medicine set great store by "*specifics*" *Paracelsus* had his "Specificum Purgans" Cophon relied on mirobolanum or rhubarb in relieving *constipation.* Suppositories of honey and oxgall had their day in the fifteenth century.

Medicine has since made notable advances toward rationalism In this day of therapeutic progress Agarol Brand Compound holds the foremost place An exceptionally fine emulsion of mineral oil and agar-agar with phenolphthalein, it is not merely a laxative, but a remedial measure in the efficient treatment of constipation

By introducing unabsorbable moisture, Agarol Brand Compound keeps the intestinal contents soft and makes their passage easy and painless By *gentle stimulation* of peristalsis, it makes the result certain and aids in re-establishing normal bowel function

One tablespoonful at bedtime —is the adult dose

Final decision on the true worth of Agarol Brand Compound rests with the physician We will gladly send a liberal quantity with literature, for trial.

AGAROL *for Constipation*

VACCINES

For Respiratory Infections

PROPHYLACTIC inoculation against the common "cold," influenza and catarrhal conditions of the respiratory tract generally, has given a high degree of immunity in a large number of cases

¶ The micro organisms most commonly found in patients suffering from "colds" are Pneumococcus, Pfeiffer's Bacillus, Micrococcus catarrhalis and Bacillus septus and these are included in the **Anti-Catarrh Vaccine** prepared in the Department for Therapeutic Inoculation, St Mary's Hospital, London, W, especially for the prophylaxis of colds in adults

A slightly modified formula is supplied under the title **Anti-Catarrh (Public Schools) Vaccine.**

¶ Vaccine treatment of respiratory infections often helps to abort an attack **Cold Vaccine (Mixed)** is specially prepared for therapeutic use in connexion with common "colds" and bronchitis It is suitable for routine use, as its composition has been chosen so as to avoid the necessity of a bacteriological examination

¶ It is generally agreed that the serious and sometimes fatal complications of influenza—such as bronchitis and pneumonia—as well as many of the less severe symptoms, are caused by infection with Pfeiffer's Bacillus, Pneumococcus and Streptococcus On this account the **Anti-Influenza Vaccine (Mixed)**, *St Mary's Hospital Formula*, which contains these three organisms is of great value as a prophylactic of influenza

Further particulars of these and other Vaccines prepared in the Department for Therapeutic Inoculation, St. Mary's Hospital, London, W, will be sent on request

JUST ISSUED.

Andrews' Dermatology

This new work on diseases of the skin presents that subject from a fresh viewpoint Dr Andrews has placed the practical above everything else, stressing those methods, those treatments, those procedures which have been proved of value in actual practice

Dr Andrews sweeps away the usual difficulties of diagnosis by his sharp clinical pictures of each disease Conditions are classified as to their regional peculiarities, symptoms are detailed in life-like word-pictures, differential diagnostic methods are given completely

Then is to treatment Here Dr Andrews gives not merely the principles but the actual practical steps of technique, the selection of methods, the writing of prescriptions, the correction of the diet, the application of the roentgen-ray and the use of all methods that have been proved of value

The illustrations are remarkable Together they form what is virtually an atlas of dermatology There are almost a thousand of them—photographs and drawings, and they supplement the text in a way which makes Dr Andrews' presentation of the subject unusually clear decidedly definite

Octavo volume of 1075 pages with 988 illustrations By GEORGE C ANDREWS M D Associate Professor of Dermatology College of Physicians and Surgeons (Columbia University) New York City Cloth 55s net

JACKSON & COATES: NOSE, THROAT, EAR

"A FAITHFUL PICTURE OF THE BEST MODERN PRACTICE"

*It would be impossible to appraise the merits of all the articles so varied and so diverse but as they must be taken collectively it may be said that on the whole they maintain a high level and give a faithful picture of the best modern practice with copious illustrations and admirable coloured plates —*BRITISH MEDICAL JOURNAL

Edited by CHEVALIER JACKSON M D Sc D LL D F A C S Professor of Bronchoscopy and Esophagoscopy University of Pennsylvania and Jefferson Medical College and CLAUDE L COATES M D A B F A C S Professor in Otology University of Pennsylvania Graduate School of Medicine Assisted by CHEVALIER L JACKSON A B M D Assistant in Bronchoscopy and Esophagoscopy Graduate School of Medicine University of Pennsylvania Cloth 68s net

NORRIS & LANDIS: CHEST and DIAGNOSIS

"OF OUTSTANDING AND RECOGNISED MERIT"

*Norris and Landis's Diseases of the Chest is a work of excellent outstanding and recognized merit that there is no need to introduce and its fourth edition to our readers But perhaps there are still a few physicians who have not realized the particular merits of the work if there are to any such just beginning the study of the heart and lung and especially if they intend to teach they will be well advised to buy a copy at once This fourth edition is an excellent example of careful revision and discreet addition The book was originally planned and written for the clinician and equipment slight alterations have rendered it suitable for him It is probably the best book of its kind —*BRITISH JOURNAL OF MEDICAL SCIENCE

By GEORGE W NORRIS M D Professor of Clinical Medicine at the University of Pennsylvania and H P M LANDIS M D Sc D Director of the Clinical and Sociological Departments of the Henry Phipps Institute University of Pennsylvania With a chapter on the *Electrocardiograph in Heart Disease* by EDWARD B KRUMBHAAR M D Director of Laboratories of the Philadelphia General Hospital Octavo of 934 pages with 478 illustrations some in colour Fourth Edition Just Issued Cloth 50s net

BECKMAN: TREATMENT IN GENERAL PRACTICE

'SHOULD BE IN THE HANDS OF EVERY PHYSICIAN

*"Great as has been and is the need for the literature of applied pharmacology there is probably no department of medicine which has been more frequently and more grossly neglected Here at last is a book which gives in painstaking and exhaustive analysis of orthodox and putative therapeutics a modern critical and detailed study of technique and dosage This book or its equivalent should be in the hands of every physician and the latest edition of some certain its equivalent. —*LANCET

By HARRY BECKMAN M D Professor of Pharmacology at Marquette University Milwaukee Octavo of 899 pages Cloth 45s net

NEW WORK. NOW READY

SICK CHILDREN: DIAGNOSIS AND TREATMENT

A Manual for Students and Practitioners

By DONALD PATERSON, B.A. Manitoba, M.D. Edin., F.R.C.P. Lond.

In this Manual the Author places at the service of the reader his experience as a pædiatrist. While due consideration is given to the etiology and pathology of children's diseases the main stress is laid on diagnosis and treatment.

The book is amply illustrated.

Crown 8vo. 542 pages. With 16 Half-tone Plates and 85 Text-figures. 16s. net.

FIFTH EDITION. READY Sept. 18th.

THE STUDENT'S HANDBOOK OF SURGICAL OPERATIONS

By SIR FREDERICK TREVES, Bart.

Revised by CECIL P. G. WAKELEY, F.R.C.S. Eng., L.R.C.S. Edin.

Mr. Cecil Wakeley has carefully revised and added many new illustrations to the late Sir Frederick Treves's classic Handbook. Among the features new to the book are chapters or sections on the Treatment of Cancer by Radium, the Treatment of Varicose Veins and Hæmorrhoids by Injection, the Treatment of Congenital Dislocation of the Hip, and of Lacerated Cartilages of the Knee.

Crown 8vo. 550 pages. With 190 Text-figures. 10s. 6d. net.

DEMONSTRATIONS OF PHYSICAL SIGNS IN CLINICAL SURGERY

By HAMILTON BAILEY F.R.C.S. (Eng.)
Surgeon Dudley Road Hospital Birmingham

The illustrations have been still further improved and increased in number for this edition.

LANCET.—This excellent book has been enlarged. Many new pictures have been added and those of the high standard of the first. Mr. Bailey must be congratulated on the production of a work which gives just that assistance which is needed by the medical student attending his first clinics. It has won deserved popularity and we predict for it a long and successful life.

BRIT. JOUR. SURG.—An admirable book which we can recommend to all students.

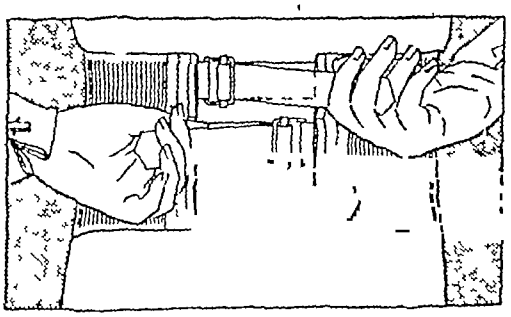
THIS NEW *FLEXIBLE* SUPPORT

IS APPROVED BY LEADING SURGICAL OPINION

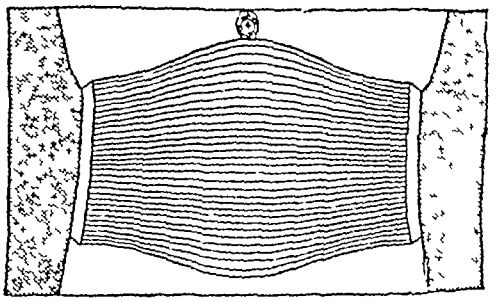
Brit Pat No 278477



Being Pliable, it Exerts a Firm yet Natural Compression without Restriction

The Linia Belt represents a definite step forward in modern surgical belt construction, and its patented principles are widely approved by leading professional opinion.

This belt, designed by anatomical experts, is the result of 25 years' research and experiment in making elastic supports to medical requirements. The efficiency and comfort of this method of abdominal control is vouched for by the many prominent medical men who have adopted the Linia Belt for their personal use



THE ACTION OF THE LINIA BELT

The Linia Belt, being made entirely in an exceptionally tough elastic tricot, with firm back and strong extendible front, gives the firm and efficient support so necessary for post-operation wear *without employing any rigid components* Thus it allows complete freedom in movement and breathing Corpulence is reduced by a gentle massage action and a *natural compression* exerted which restores any displaced muscles and organs to their natural conformation Recommended for post-operation wear in cases of Intestinal Ptosis, Enteroptosis, Visceroptosis, Gastroptosis, Nephroptosis

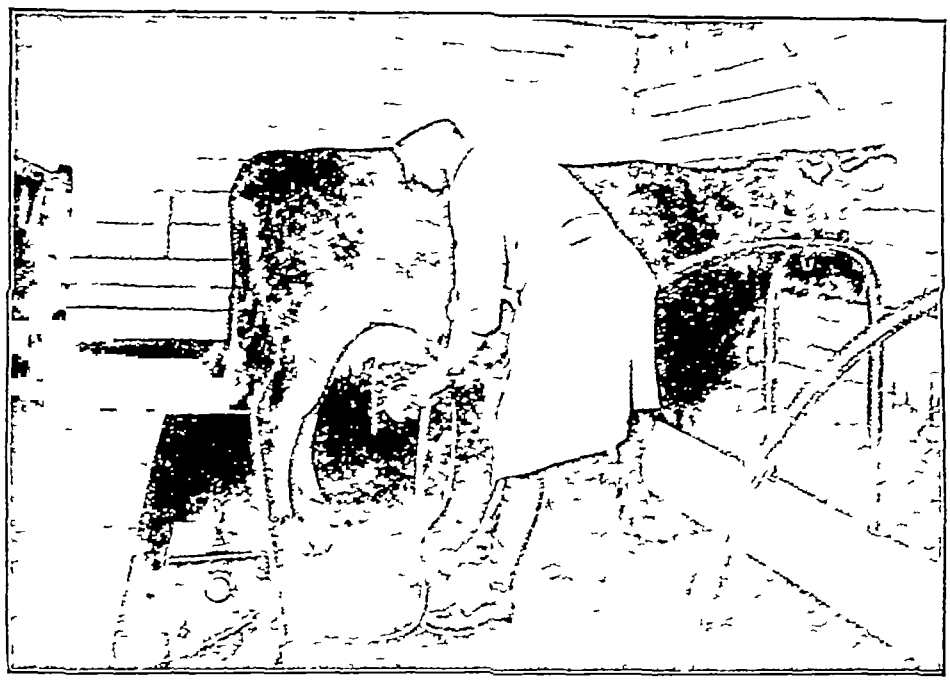
BACK VIEW

The tough live horizontal elastic of this special tricot can be regulated to the required tension by means of slide buckles Thus its lifting and *massaging* powers are easily controlled As the abdomen resumes its normal conformation further adjustments of the slide buckles can be made

FRONT VIEW

At the front of the belt the thin tricot of great strength can be extended to the required depth, so that a gentle pressure *is exerted on the full area* of the abdomen Pressure is applied from pubis to groins as a safeguard against rupture

We invite you to submit this belt to your own tests



We shall be pleased to forward a Linia Belt for your inspection free of charge *POST ORDERS* can be carried out to your direction on receipt of exact measurement round girth and required depth from pubis upwards Standard depths, 9, 10, and 11 inches *Prices* Standard Model, 2½ guineas In black thread and elastic, 3 guineas, in pure silk and elastic, 6 guineas Post free in United Kingdom

The Linia Belt

is on sale only at

J ROUSSEL, 173, Regent Street, W.1 *(Special Branch for Men's Abdominal Belts)*

MICKLEFIELD IRRADIATED MILK

TREATING THE COW

By this Process—

(1) VITAMIN A AND NATURAL FLAVOUR ARE PRESERVED
(2) VITAMIN D CONTENT IS INCREASED 1,800 PER CENT., OR TEN TIMES THAT OF ANY OTHER IRRADIATED MILK.

One pint equivalent in Vitamin D to 600 drops or 12 grammes of average Cod-Liver Oil

A ten weeks test recently conducted at the Infants School Rickmansworth under the supervision of the Medical Officer of Health gave the following results —

(1) 18 children (controls) had their usual ordinary milk.
(2) 29 " 1/3 pint of Grade A (T T) milk five days a week.
(3) 30 " Micklefield " " "

(1) Average increase in height 603 in (2) Average increase in weight 9·72 ozs more than (1)
(2) " " " 610 in (3) " " 10·9 ozs more than (1)
(3) " " " 744-in

Full particulars appeared in an article in the LANCET January 18 1930 p 127 et seq a reprint of which will be sent post free on request

The milk is delivered every week-day in London, elsewhere by arrangement.

WHEN SOLID FOODS CANNOT BE TAKEN THESE ESSENCES

STIMULATE AND RESTORE VITALITY RAPIDLY

THE value of Brand's Essences in illness and convalescence is recognized by an overwhelming majority of modern doctors Out of *every 100 recently interviewed* 99 prescribed this famous product for their patients

Brand's Essences are the unadulterated juices of the finest freshly killed meats conserved by a unique process in their natural form—a clear, appetizing jelly They contain no added substance such as colouring matter, gelatine or preservatives which could hinder assimilation Their effect on the gastric juices is immediate—they stimulate these secretions to instant activity

During acute illness—particularly pneumonia or gastric disorders—they form an invaluable restorative through those periods when the system is incapable of digesting solid food

And in convalescence, Brand's Essences excite appetite—overcome that reluctance to eat so apparent after nearly every dangerous illness

Brand's Essences can be obtained at chemists and stores throughout the world in tins and glasses On receipt of a professional card, trial samples will be sent to you Write Dept F11 Brand & Co Ltd, Mayfair Works, Vauxhall, S W 8

VERONIGEN

A liquid preparation of the Hypnotic Barbitone or Diethyl barbituric acid has long been desired as a useful means of procuring sleep When given in reasonable doses it is claimed that it does not produce any toxic symptoms whatever nor is cumulative in action and in ordinary cases of insomnia one fluid drachm of VERONIGEN is sufficient dose for an adult As a preventive of post-operative vomiting one to two fluid drachms of VERONIGEN may be given one and a half to two hours before general anæsthesia is produced and as a result much less of the anæsthetic is required As BARBITONE has a slight diuretic action the mixture can be used when the heart is weak Where sleeplessness is a concomitant of pain rest and relief can frequently be obtained by the administration of one drachm of VERONIGEN and two drachms of ELIXIR ACID ACETO-SALICYLIC (Hewlett s)

DOSE FOR ADULTS—One fluid drachm diluted one hour before going to bed
For Nervous Sleeplessness in Children—10 to 20 minims diluted

VERONIGEN Price 10/6 per lb In 5, 10, 22, 40, and 90 oz. Bottles

Introduced and Prepared only by C J HEWLETT & SON, LTD Wholesale and Export Druggists

PHYSIOLOGICAL TREATMENT OF CONSTIPATION

TAXOL

COMPOSED OF

EXTRACT OF THE INTESTINAL GLANDS, which strengthens the glandular secretions of the organ
BILIARY EXTRACT, which regulates the secretion of the bile
AGAR-AGAR, which rehydrates the contents of the intestines
LACTIC FERMENTS, anti-microbian and anti-poisonous action

IN TABLET FORM *ITS USE DOES NOT LEAD TO HABIT*

Laboratories. **LOBICA**, *46, Avenue des Ternes, PARIS (17e)*

PITUITARY
(Posterior Lobe)
EXTRACT
B.D.H.

Current organotherapeutic work shows that the pituitary hormones are of even more importance than was imagined hitherto

The physiologically-active principles of the posterior lobe are of the greatest service not only in obstetrics but also in a number of seemingly diverse conditions such as surgical shock intestinal stasis haemorrhage, the polyuria of diabetes insipidus and in insulin hypoglycaemia

The special need for the use of a reliable standardised pituitary preparation is obvious, since different samples of products of this nature often vary considerably in activity

Pituitary (Posterior Lobe) Extract B.D.H is a stable solution of uniform potency and efficacy every batch being tested for oxytocic power and for pressor effect before issue.

A safe and simple antacid which is also a gentle laxative must necessarily be of great value to medical practitioners when administering to ladies and children and all who are constitutionally delicate

May we, therefore, venture to remind you of

DINNEFORD'S PURE FLUID MAGNESIA

which has been extensively prescribed and used by the Medical Profession for a Century and is still the best and safest means of administering Magnesia.

When prescribed for the nursery too, Dinneford's Magnesia has always proved immensely useful as a corrective, and when mixed with infant's food it prevents many of the troubles which are due to acidity flatulence, etc.

We are confident that you will find in Dinneford's Fluid Magnesia a reliable and safe solution which may be freely used for many ailments, and we would request your kind consideration of its use as occasion offers.

Dinneford's Pure Fluid Magnesia possesses antacid and laxative qualities which are incomparably better than those of any of the various preparations of Magnesia, in powder, now being introduced
It cannot harm the most delicate constitution and is at all times a safe and effective laxative
Manufactured in London for the past 100 years

MEDULLA RUBRA

BONE-MARROW IN ANAEMIA FROM HAEMORRHAGE

W Borchardt (*Deut med Woch* March 28th, 1930, p 521) records the results of his experiments on young dogs in which anaemia had been artificially produced by the removal of about half their blood In the first series some of the animals were fed with rib marrow, others with marrow from the long bones Control animals received a corresponding amount either of fat or of liver extract The basal diet in each case contained a sufficiency of iron (5 mg per cent) Only the animals receiving the red rib marrow showed a definite increase of weight, and their haemoglobin formation was more rapid than that of the others. In the next series the experiment was repeated, but the iron content of the diet was reduced to 1 4 mg per cent The result was similar but more striking the dogs receiving the rib marrow regaining their haemoglobin far more quickly than the others

THIS extract from the "Epitome of Literature," published in the "BRITISH MEDICAL JOURNAL," dated May 3rd last, is important as representing, in 1930, a complete justification of the formula upon which

Roboleine
THE FOOD THAT BUILDS THE BODY

has been produced without variation during the past twenty five years

The success of ROBOLEINE is thus due to intelligent anticipation and to consistently maintaining the highest possible standard of manufacture

Medical Practitioners are asked to satisfy themselves of the merits of ROBOLEINE, for which purpose testing samples will be gladly sent upon request.

REGETHERM POULTICE
(Cataplasma Kaolini. B.P.C)
CLEAN & CONVENIENT IN USE

More certain in its action than the old-fashioned poultice

The healing action of Regetherm Antiphlogistic Poultice is governed by its ability to prolong and maintain an even degree of heat over a lengthy period Moreover, the ingredients are so balanced that this action does not set up any counter-irritation, but allays pain, ensures an even circulation through the congested areas, and thus induces natural and pain-free rest

The Medical Profession will appreciate the fact that the action of Regetherm Poultice is much superior to that of fomentations or linseed poultices, and can be relied upon as an efficient aid in the treatment of all types of inflammation—whether local and superficial, or of deep seated origin

SPECIAL DISCOUNT TO THE MEDICAL PROFESSION

FLATULENCE AND ALIMENTARY FETOR

MANY conditions are associated with flatulence, some of which frequently give rise to embarrassment of distant organs

Dyspepsia, catarrh and ulceration of the stomach and intestine, cancer, dysentery, and other diseases of the alimentary canal itself, neurasthenia, and diseases of the heart, liver and pancreas, to name only a few, may all be associated with flatulence and intestinal flatus

Some of the diseases of the intestine, such as dysentery and cancer, are often also associated with horrible fetor of the evacuations

The accumulation of flatus in the stomach and intestine is liable to embarrass the action of the heart and lungs giving rise to dyspnœa, disordered action of the heart, faintness and even anginal attacks

Both the flatulence and fetor are the result of abnormal fermentation and putrefaction of the contents of the alimentary canal, apart from treatment of the condition itself, it can be rationally controlled by the use of an efficient intestinal disinfectant. For this purpose, Kerol, the most potent germicide, being unabsorbed and non-toxic, is unsurpassed, and can be safely administered in sufficient amount to exert its germicidal action

When the fermentation is located in the stomach, KEROL CAPSULES (Gastric) m. 3, should be administered one or two may be given three or four times a day after meals

When there is intestinal flatus and fetor, the keratin-coated KEROL CAPSULES m 3, should be used, the dose being one to three after meals.

M 232

A Distinct Advance Over Preparations of Acetyl-Salicylic Acid

Acetyl salicylic acid possesses a notable disadvantage Physicians have proved that it cannot be tolerated by patients suffering with a delicate stomach Consequently, the value of this medicament in the wide field in which it is indicated is very seriously reduced

"Alasil" completely overcomes this objection By combining calcium acetylsalicylate with "Alocol," unfavourable secondary action upon the stomach is prevented This beneficial influence is undoubtedly due to the presence of "Alocol" (Colloidal Hydroxide of Aluminium), which preparation has brilliantly stood the test of practice in the treatment of hyperacidity and other ill conditions of the gastric tract "Alasil" is therefore a triumph over acetyl salicylic acid It enables higher doses to be administered and maintains the patient's system under its influence for a greater length of time Analgesic, Antipyretic and Sedative, "Alasil" is indicated in all cases where acetyl salicylic acid has been used heretofore

A supply for clinical trial with full descriptive literature sent free on request

Vitamin Deficiency—Growth and Development

By "PATHOLOGIST"

The effect of vitamin B deficiency on growth and development is well shown by the following experiment carried out in the Bemax Laboratories.

Three female rats, almost fully grown, were placed on a vitamin B deficient diet consisting of rice starch, casein, New Zealand butter, McCullum's salt mixture and water.

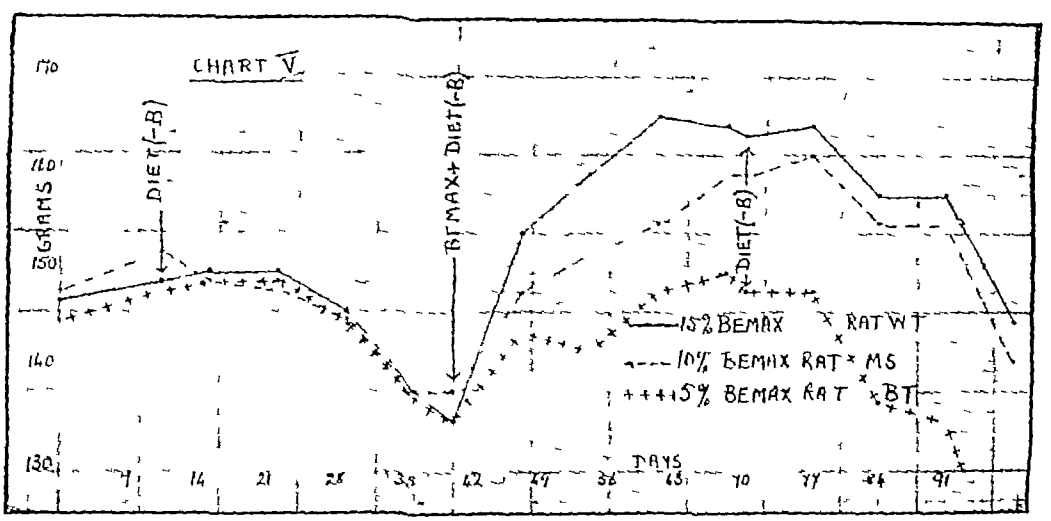

Chart showing result of adding 15% 10% and 5% of Bemax to Vitamin B deficient diets of animals.

It will be noted from the chart that the rate of fall in weight was approximately the same in each case

The growth curve of rat W T is shown in the chart by the unbroken line, that of rat M S by the broken line and that of rat B T by the line of crosses.

On the 30th day 15% of BEMAX was added to the diet of rat W T, 10% to that of rat M S and 5% to that of rat B.T

Immediate increases in the weight of all three rats will be noted—that in the case of rat W.T (15% BEMAX) being more rapid than the others. The curves of rats W T. and M.S show rapid increases, but that of rat B T is not so pronounced

Four weeks later the BEMAX was removed from all the diets, and on the seventh day each animal commenced to lose weight Decrease in weight continued steadily in the case of the three rats at approximately equal rates

This, and further experiments, prove that the storage of vitamin B is very limited, and point to the necessity for the inclusion of a regular and adequate amount of this essential vitamin in the diet of human beings

Detailed reports of further research work will be sent on request to members of the medical profession

Observations on THE TREATMENT OF CONGENITAL DISLOCATION OF THE HIP*

BY

HERBERT P. H. GALLOWAY, M.D., C.M., F.A.C.S.,

ORTHOPAEDIC SURGEON, WINNIPEG GENERAL HOSPITAL

A discussion of the treatment of congenital dislocation of the hip naturally resolves itself into a consideration and comparison of manipulative methods and open operations. It is barely thirty years since this disability was generally recognized as having been emancipated from the list of affections regarded as incurable. Prior to that time, once the diagnosis had been made, and the nature of the condition explained to the parents of the child, or to the patient himself, if old enough, the surgeon dismissed the case feeling that all that was possible had been done. Then came the quickening of interest and kindling of hope which resulted from the work of Lorenz, followed by the universal adoption of his manipulative method, the inevitable evolution of various modifications and improvements, and the development of open operations to be applied in cases which resisted manipulation, until to-day it may be said of this recently hopeless disability that, given an early diagnosis, anatomical and functional cure should be the rule and failure the exception, while even old and neglected cases are by no means quite beyond help.

Manipulative reduction is undoubtedly still the method adopted by the majority of surgeons in treating young patients, and sometimes those who are older. The original technique of Lorenz is still largely used, although many prefer one of the various modifications, the Denucé method being probably the most popular among those who have mastered it. Although statistics of the results of manipulative treatment present such extraordinary variation as to be largely valueless, there seems to be abundant evidence that in the hands of experienced operators a large proportion of the cases in young children can be permanently cured by manipulative methods.

When Lorenz first made his triumphal tour of American clinics I had the privilege of seeing him carry out his method on several patients, and the demonstration was striking and convincing. Full of enthusiasm I returned home, and immediately applied my newly acquired knowledge in the case of a girl, aged 3, with dislocation of both hips, a perfect anatomical and functional cure resulted. Unfortunately, however, this encouraging initial success was followed by a series of failures and incomplete cures, with only an occasional really satisfactory result, and I soon came to feel that a most uncomfortable uncertainty dogged my efforts to treat this disability. Diligent inquiry among some of my orthopaedic friends, and examination of cases treated by them, convinced me that their experience closely resembled my own.

My conversion to the open operation came in 1904, although for several years after that I employed it only occasionally and with misgiving born of inexperience. In June, 1904, the late Dr. Harry M. Sherman of San Francisco read a remarkable paper in which he advanced what seemed to me an unanswerable line of argument opposing manipulative reduction, and favouring arthrotomy as the routine treatment. I wish to quote at some length from Dr. Sherman's paper:

"As regards the manipulative method *I am sure that Lorenz* told the whole truth when he stated that the obstacle to reduction was the narrowed part of the capsule at the posterior and superior or superior part of the *acetabular rim. If the* opening at this narrowed part is big enough *to permit* the head to pass reduction can be accomplished by manipulation and may be maintained *if* the acetabulum is deep enough. I have in two instances done this. I know but in the twenty-eight hips in which I have done arthrotomy and in which I have explored the narrow part of the capsule by my finger and so know its size and the strength of its walls, there has been but one case in which the passing of the head would have been possible. *I am not too dogmatic when I say* that no possible force could have put the femoral head through the narrow part of the capsule *in any* of the other cases. One possibility and twenty-seven impossibilities! Now what happens when attempts are made to accomplish this impossibility? Lorenz has reported plenty of fractures of the femur and one each of pubis and of *the ilium* and other operators have done the same.[1] Lorenz reports seven cases of paralysis out of four hundred odd operations but Taylor[2] looking carefully for the condition, finds eleven cases in less than fifty operations by various *operators* including I believe Lorenz himself. My own contribution to the casualty list is the report of a case of Lorenz's own of rupture of the capsule of the hip-joint distal to the constriction *and the thrusting* of the femoral head out among the muscles of the thigh. While only one case was shown we have had this accident still from the similarity of the clinical conditions I believe another had it and it is not in the least impossible or improbable that it occurs in very many cases especially in the class called anterior transposition. Finally on all sides one finds the absurdity of the term bloodless pointed out and the reference to the lacerations of the *muscles*, the extravasations of blood and haematomas. And last of all Lorenz has reported one case of gangrene of the whole lower extremity. These accidents must make anyone who is not an enthusiast or a special pleader stop and think. One must say that to justify the exposure to such risks the percentage of successes anatomic and functional must be high so that the benefit may in the opinion of all outrank the possible harm. What is the percentage of successes? From what we have seen of the Lorenz results scattered between Boston and San Francisco we cannot believe that he ever really got good anatomic results in about half of all his cases.

Even if it be granted that Dr. Sherman presented an extreme view, and that his criticism of Lorenz's results was based in part upon the unwise application of the manipulative method to unsuitable cases, the essential fact brought out by him is that the entrance to the acetabulum is too constricted to permit the head to pass through it. I have personally verified this many time. But if Sherman's contention be true how are we to account for the fact that so many undoubted cures are brought about by manipulative methods? In my opinion in nearly all cases treated by manipulation the head does not at the time of apparent reduction fully enter the acetabulum, *nothing intervening between the cartilage covering the* head and the cartilaginous lining of the acetabulum. I believe that a wall of soft tissue is pushed before the head, and that this gradually disappears by pressure absorption during the prolonged retention in the abducted position, which forms such an essential part of the after-treatment of these cases.

I have long felt that the objections to the open operation do not rest upon a sound foundation. The word "bloodless" so frequently applied to manipulative methods is captivating, but to anyone who has seen the enormous haematomas which so frequently attend the Lorenz method this term makes no very convincing appeal. Then it must not be forgotten that almost overnight the Lorenz method of treatment was eagerly and universally adopted by the profession as the solution of the problem of treating these hitherto incurable cases, and treatment by manipulation soon became an established tradition, with the result that comparatively few surgeons have gained any extended experience with the open operation. Again we must remember that thirty years ago orthopaedic *surgery in general* was much more the mechanical and manipulative department of surgery than it is to-day. *Few indeed of the orthopaedic* specialists of that time were trained operators and as the great majority of congenital dislocations came into the orthopaedic *department* manipulative reduction was practically the only method of treatment attempted. As I have said *on other occasions* each worker in the field of the open operation for this condition has been more or less a pioneer because the almost universal employment of manipulative methods has left the open operation largely without either teachers or students. Because manipulative methods produced results which were on the whole an enormous advance over the impotence of the era when these cases were classed as incurable, there developed too

* Made in opening a discussion in the Section of *Orthopaedics* at the Annual Meeting of the British Medical Association, Winnipeg, 1930.

general a feeling that both patient and surgeon should be congratulated even if results were often far from ideal At the present time, given hospital facilities of the highest type, a surgeon to whom absolute asepsis has become a confirmed automatic habit, and who has acquired the necessary experience with this particular operation, it should be almost as safe as a tenotomy, and as likely to result successfully as an osteoclasis for bow-legs or an osteotomy for knock-knee, provided that one other factor is present That factor is that the patient must be from 20 to 36 months old, and must never have been previously treated by manipulation It is at this point that I come into conflict with many if not most of those who perform the open operation in certain cases I believe the general teaching is that open operation should be held in reserve as a last resource where manipulative reduction has failed I have always contended that such teaching is not merely wrong, but mischievous The powerful grip with which traditional teaching holds the profession in regard to this particular surgical condition is well illustrated by a statement which occurred in a paper published in the *Lancet* about ten years ago by Mr A H Tubby He says

"No matter what the age of the patient may be, no resort is made to open operation until every effort has been made to reduce the dislocation by the manipulative method In one instance, no fewer than eight such unsuccessful attempts were made Portions of the adductors had been excised, extension had been tried by heavy weights for several weeks, traction by pulleys up to the danger point had been used, and even when the trochanter major had been pulled down one inch below its normal position we found that flexion, hyperextension, abduction, circumduction inwards and outwards were all unsuccessful"

Such persistent unsuccessful efforts at manipulative reduction before resorting to open operation not only accomplish no good, but do great harm, and bring the open operation into undeserved disrepute Tissues which have been bruised and scarred, and that have had their power to resist infection lowered by the traumatism inseparable from such unwise manipulative efforts, do not afford an inviting field for subsequent cutting operations, and cannot function as satisfactorily after the operation as tissues which have not been treated so unkindly

In a young child the exposure of the hip by the Sprengel or Smith-Peterson approach is a simple procedure, and can be carried out rapidly and with little or no shock to the patient Once the capsule has been opened and the constricted portion enlarged, reduction can be accomplished with almost no traumatism Further, with the limb rotated inwards and maintained in moderate abduction of from 40 to 60 degrees, the head is so deeply buried in the acetabulum that with the most ordinary care there is no tendency to redislocation during the closure of the wound When a plaster dressing has been properly put on, recurrence is practically impossible, no matter what position the patient is placed in *In my opinion, the actual* traumatism is less, not more, in the average case, than when the manipulative method is employed

Other things being equal, it must be granted that if a congenital dislocation can be reduced in a few minutes by an easy manipulative procedure which requires no elaborate surgical technique, it should be chosen in preference to an open operation which demands perfect asepsis, and which should never be attempted except by a highly trained surgeon But are other things equal? Denuce teaches that his patients must not be allowed to begin walking until about one year has elapsed from the time reduction was effected, and he appears to regard as essential an elaborate course of after-treatment extending over many months, and even as long as two and a half years Contrasted with this, after the open operation in children, walking in the plaster is encouraged within a month, and the plaster is abandoned and no treatment considered necessary after five or six months Indeed, I believe the plaster could be removed with safety and all further treatment dispensed with much earlier in most cases, but I have not felt justified in taking chances in order to discover the minimum safe period of after-treatment It is highly undesirable to keep the pelvis of a growing child enclosed in plaster for a year if half that period will suffice The extended period of after-treatment insisted upon by Denuce and others is not only an objection in itself, but I think it lends support to my belief that cure by any manipulative method can be brought about only by pressure absorption of capsular tissue, which more or less completely blocks the entrance to the acetabulum In other words, reduction by manipulation is usually at first incomplete, and it becomes stable only after the capsular tissue pushed before the head has disappeared On one occasion I performed the following experiment I reduced the hip by manipulation, and immediately took an x-ray picture The head was opposite the acetabulum, but not deeply within it I then performed an open operation and took another picture, which showed the head much more securely related to the socket

It is granted that the open operation should never be attempted except by trained surgeons who can operate under conditions such that the failure of any link in the chain of asepsis is practically impossible, but if this be an objection, it applies equally to many other surgical procedures, and should not deter the surgeon who has learned to have confidence in himself and in the environment in which he operates

The objection sometimes raised to undertaking early treatment, even by the manipulative method, is the difficulty of keeping the plaster from becoming soiled, but this is a less serious problem to ingenious and conscientious nurses than to those who study to escape any avoidable trouble or exertion At any rate, in my experience, it does not offset the greater ease with which reduction can be effected in younger patients While I operate on children as young as 19 or 20 months, it may be stated that from 2 to 2½ years is perhaps the ideal age In a general way, the operation becomes more difficult and uncertain as age advances, but there are exceptions to this rule It may be anything but easy in a child aged 4 or 5 On the other hand, in the exceptional cases where the hip is lax and the head can be moved up and down on the ilium to a considerable extent, reduction may be quite easy in a patient aged 10 or 12 In children aged 3 years or younger who have never been subjected to manipulation, the ligamentum teres is usually intact, and is an important guide in locating the acetabulum In older children and in those who have been subjected to a previous manipulative effort the ligamentum teres may be absent, or, if found, detached from the head and curled up in the socket Exceptionally I have found the ligament so voluminous as to occupy too much space in the acetabulum, interfering with the deep burying of the head which is so desirable, and, on this account, I have occasionally detached it and removed a large part of it Sometimes even in the younger children the acetabulum is found so shallow, or its roof so sloping, as to jeopardize the result When this condition is encountered, a wide chisel curved on the flat is driven almost horizontally into the ilium to the depth of about three-quarters of an inch, just above the upper rim of the acetabulum, and after prying down the roof of bone thus loosened, bone chips cut from the ilium are wedged into the gap created by the chisel The same procedure has been adopted with complete success at a second operation in a few cases where the shallow condition of the acetabulum had permitted redislocation to occur

Before dismissing the matter of treating congenital dislocation in young patients, reference should be made to a recent article by Dr Charles H Jaegar of New York He pleads for earlier diagnosis, and describes a new and simple plan of treatment which he claims can be used successfully in infants as young as 3 or 4 months His article, which appeared in *Surgery, Gynecology and Obstetrics*, April, 1930, is illustrated by some striking x-ray pictures of two cases, one set of pictures being those of a child of 7 months old when treatment was begun, while the other patient did not come under his care until the age of 2 years and 7 months Jaegar argues that the shallow condition of the acetabulum is caused by pressure of the dislocated femoral head against its upper rim during the first months of life when growth and development are very active, and that this pressure prevents the normal development of the acetabulum He states that removal of this pressure is promptly followed by development of the upper rim, and points to his x-ray pictures as proof His

plan of treatment is as follows The child is placed in a long hip splint of rustless steel This splint consists of two circular bands to fix the pelvis and chest, and two lateral bars to support the legs The lower ends of the bars are furnished with a foot plate and leather anklet, the function of which is to maintain a mid position of the leg as regards inward and outward rotation The long outer bar is bent to fit the patient with the lower extremity abducted to 45 degrees Gradual reduction is accomplished by an adjustable pad pressing downward and inward on the trochanter this pad being controlled by a wing screw about one and a half inches long In his first case the splint was worn for eight months In the second and older patient it was discarded in a little over four months He considers three months sufficient Weight bearing is not permitted during the treatment and he challenges the theory that functional weight bearing is necessary for deepening the acetabulum. He claims that x-ray pictures taken at *frequent intervals show unmistakably* that the upper rim of the acetabulum begins to develop rapidly as soon as the pressure of the head against it has been removed and he suggests that the damage to the head seen so regularly in later years in cases treated by other methods may be due to the fact that the soft cartilaginous head is supposed to pound out a hollow in the harder socket

Treatment of Older Patients

Granting that congenital dislocation of the hip is usually curable in young children the problem of successful treatment in older patients remains a formidable one Inasmuch as I never attempt manipulative reduction at any age, it is only natural that I should protest against attempts at manipulative reduction and plead for some form of open operation in all patients who have passed the early favourable period To me it seems altogether unjustifiable to use the amount of force so often employed, and especially to subject the patient to repeated attempts at reduction after the first efforts have failed

Starting from this point my discussion of the subject narrows down to a consideration of the kind of open operation to be chosen after the favourable early period has passed. In my opinion actual reduction of the head into the acetabulum may be attempted by much the same method as I employ in children in any patient irrespective of age provided the case be one of those exceptional ones where the hip is lax and *where the femur moves up* and down until its upper limit is within a short distance, say one inch or less, of the roof of the acetabulum

Preliminary traction, advocated by some writers is practically valueless in my opinion, unless it be applied directly to the skeleton, and even then its advantage is doubtful There is however, a little-known method of using traction which I employ regularly in fractures of the femur which may reasonably be expected to yield some result, if continued for several weeks This method was originated by Michael Hoke of Atlanta, Georgia U S A Into a short plaster spica, which surrounds the pelvis and upper part of the thigh on the injured side, are incorporated the side bars of what is practically a Thomas splint minus the ring The thigh portion of the plaster is *little more than a wide collar* and its upper edge must not come within a couple of inches of the perineum The plaster is also carried down on the opposite extremity so as to include the foot which is placed at right angles to the leg In treating fractures of the femur in young children the usual adhesive strips may be used, but skeletal traction is preferable in older children and adults, and in applying this method to congenital dislocation, skeletal traction is indispensable Callipers may be used, but my personal preference is for a pin passed through the femur just above the condyles The degree of traction can be accurately controlled by a butterfly nut arranged on a screw, as shown in the illustration The plaster is applied over very abundant padding so that it fits the patient's body and limbs loosely As soon as traction is applied, it tends to push the whole plaster dressing up on the patient's body but the plaster cannot move upwards owing to the inclination of the opposite limb Thus perfect resistance is provided and all counter-pressure comes against the broad sole of the foot a surface which is not only adapted to pressure but accustomed to it instead of being secured by the ring of a Thomas splint pressing against surfaces not so well adapted to pressure The pin through the bone if aseptically introduced, causes neither trouble nor pain Whether we use or discard preliminary traction there are other aids to the descent of the femur division of the iliopsoas, and subcutaneous section of the adductors and of the ilio-tibial band, may also assist in getting the head near or opposite the acetabulum, it *may then be "shoe-horned"* into place

In the cases where there is little movement of the head on the ilium, and the head is not within easy distance of the acetabulum, it will usually be better to abandon any attempt at *actual reduction and adopt some method which will* increase stability and improve function by giving support to the head when the patient places his weight on the dislocated limb The effort actually to reduce the head into the deformed acetabulum in cases where it is riding high on the ilium requires so much force and is attended by so much traumatism—to say nothing of not being exempt from actual danger—and so often results in a hip which is largely or altogether stiff sometimes with added flexion and adduction deformity that functionally the patient may be little better or even worse off than before The method of turning down a generous layer of bone from the ilium and wedging it in this position with bone chips cut from the crest of the ilium so as to form a good roof over the head is probably the simplest and safest compromise that can be devised

A most ingenious operation has recently been proposed by Hey Groves Briefly, this consists of reaming out a new acetabulum on the ilium and then, after detaching the capsule from its pelvic attachment and sewing it over the head of the femur, implanting the head covered by the capsule into the newly formed socket. The outside of the capsule grows fast to the new socket forming a most satisfactory lining and as the interior of the capsule is furnished with synovial membrane this method creates a new articulation having all the elements of a stable and movable joint This new operation has to stand the test of further experience, but it is one of those surgical procedures which appear to be sound and reasonable

I have had *no experience with the bifurcation operation* described by Lorenz It has always seemed to me wrong in principle nevertheless, many surgeons have reported so favourably regarding the improved function brought about by this procedure that it must be accepted as one solution of the problem of dealing with this deformity in adults In these old neglected cases anatomical cure is rarely if ever obtained and any method which promises improved function and lessens disability must be welcomed The Lorenz operation has the merit of great simplicity and relative freedom from risk and in view of the good results reported by many surgeons and the ease and safety with which it can be performed it may come more and more generally into use

The most difficult problem of all is furnished by the bilateral adult case Hey Groves has made an arresting suggestion in this connexion He says

> The main reason which makes the bilateral case come for treatment is pain. This will be relieved if one side can be reduced even though the side becomes almost ankylosed But

if one side is reduced and the other left, the patient will have legs of such an unequal length that she becomes more lame than ever This difficulty may be overcome and the operation of reduction made much easier by the following device The femur is exposed through an anterior incision, and cut through transversely just below the small trochanter The upper end of the femur can then easily be brought down, and turned with the head into the new socket After this has been done, the two ends of the femur will be overlapping by two or three inches This overlapping part is cut off from the distal portion, and the divided femur united over a bone peg When the patient has recovered from this operation, she will have the two legs of the same length, and, whether another operation is done or not, she will be quite freed from pain, because on one side the body weight will be transmitted directly on to the femur In actual practice, the only patient for whom I have done this is now at full work as a factory hand, and has not thought it worth while to have her second hip operated upon."

If it be true, as Hey Groves says, that once the femur has been divided transversely just below the small trochanter the upper end of the femur can easily be brought down and turned with the head into the socket, why not employ this method even in unilateral cases? It would seem to dispose at once of the problem of getting the head low enough to effect reduction, and thus other means of overcoming the obstinate resistance to the descent of the head, such as preliminary traction and division of resisting soft parts, could be dispensed with The objection that in unilateral cases there would still be inequality in the length of the limbs could be overcome by performing a second operation to shorten the limb on the unaffected side To me it seems that the suggestion made by Hey Groves possibly puts the whole subject of dealing with the older cases on an entirely new basis

BACILLUS COLI INFECTIONS.*

BY

K DOUGLAS WILKINSON, M D, F R C P,

HONORARY PHYSICIAN, GENERAL HOSPITAL, BIRMINGHAM, PHYSICIAN TO THE BIRMINGHAM AND MIDLAND FREE HOSPITAL FOR CHILDREN

EVERY clinician who works with children must be well acquainted with *Bacillus coli* infections of the urinary tract because the condition is a common one, especially during the earlier years, but as pyelitis can only be diagnosed with certainty by an examination of the urine it is difficult to form any estimate of the exact frequency of such infections The symptoms are often misleading, so that the urine is not examined, and in less severe cases the diagnosis must be missed many times for each occasion on which it is correctly made The unwary and the inexperienced, who have not pyelitis in mind and who neglect to examine the urine of small children, must fail to identify the infection, even the watchful and experienced do not always find the diagnosis easy, for the collection of a satisfactory specimen of urine may take days even under the best conditions in hospital In dealing with girls a catheter specimen is essential, since there is a great risk of contamination of the urine passed naturally, the difficulty of collecting a sample of the urine of male babies is less, but may require both skill and patience What is difficult in hospital is but seldom attempted in general practice, and here it is quite exceptional to find that the urine of a small child has been examined

The typical urine is pale and opalescent, the appearance being unaltered by the addition of acid or alkali, there is at least a trace of albumin present, and under the microscope pus and *B coli* are seen But there may be no such gross bacilluria as to produce opalescence, and the quantity of pus may not be great, so that to naked-eye examination the urine appears normal In such cases a correct diagnosis can only be made by a careful microscopic examination It is hardly necessary to add that a culture of a fresh specimen of urine is always advisable

*Read in opening a discussion in the Section of Diseases of Children at the Annual Meeting of the British Medical Association, Winnipeg, 1930

During recent years the whole subject of urinary infection has been invested with a new interest since Chown and others, working from the pathological aspect, raised important questions of the etiology and pathology of the condition These questions are of more than academic interest, for if the pathologists are correct, the clinician must revise his ideas of both etiology and pathology, and will probably have to modify his prognosis and treatment

Clinical Aspect

This infection may occur as early as the first week of life indeed, some cases have recently been labelled congenital It becomes more common at a later date, and only begins to diminish in frequency after about the eighth year In the earliest cases boys and girls seem to be almost equally affected, but at the age of 1 year the girls already outnumber the boys, and as the years pass the preponderance of girls increases These facts are pretty well established clinically, although the more recently published figures suggest that the incidence among boys is not so much less than among girls Authors differ considerably in their estimates of sex incidence

The figures from the Birmingham Children's Hospital show under 2 years, 47 cases, boys 7 (17 5 per cent), girls 40 (82 5 per cent), deaths 7 (all girls) From 2 to 12 years, 70 cases, boys 18 (25 7 per cent), girls 52 (74 3 per cent), deaths 2 These figures deal with the diagnosed cases—probably the more severe cases which needed hospital treatment, even in these more severe cases the mortality is only 9 in 117, or 7 7 per cent

Chown has made interesting suggestions to explain the disproportionate number of girls He says that the diagnosis of pyelitis, and its inherent suggestion of an ascending infection, renders girls more often suspect, so that their urine is more often examined than that of boys in whom the condition is not expected Further, since a girl's urine is liable to contamination from infections of the vulva, etc, a number of spurious cases of pyelitis are added to the real ones, and so the number of cases occurring among girls increases, while in boys whose urine is unexamined the condition is missed It is hardly likely that such mistakes can have affected my figures much, because the staff of a children's hospital are alive to the fallacies as well as to the facts of urine examination in children, and the urines to be examined are almost invariably catheter specimens, at least in girls

Symptoms

Cases may be classified as acute, subacute, or chronic The acute case often commences with a rigor or convulsions and high fever, and general disturbance which may be so severe as to suggest meningitis or pneumonia, the child is obviously ill Sometimes vomiting or gastro-intestinal disturbance is a marked feature In slightly less abrupt cases headache, backache, and general illness may suggest a typhoid or some similar infection These acute symptoms are relatively common in the younger children and make the diagnosis particularly difficult and uncertain until the urine has been examined

In older children the symptoms of pyelitis tend to be less puzzling, and constitutional disturbance is generally less severe An abrupt onset is still common, but in the majority of these cases there is some local symptom, such as tenderness in the loin, frequency of micturition, or some discomfort in passing urine to point to the correct diagnosis Still, many cases are obscure at the onset, and where vomiting is a feature the child may present the picture of a profound acidosis when first seen At times an increased respiration rate may suggest pneumonia Malnutrition and anaemia may set in rapidly, and occasionally jaundice complicates the diagnosis Malaise, rather vague aches and pains, and moderate fever may suggest rheumatism, or abdominal discomfort and tenderness may lead to a mistaken diagnosis of appendicitis or abdominal tuberculosis Indeed, there is scarcely any mistake which cannot be made in regard to these children

Many of the chronic cases show surprisingly little constitutional disturbance The patients are, perhaps, restless, imperfectly nourished children, who tend to be nervous,

but they are brought up for consultation on account of symptoms apparently wholly unconnected with the urinary tract so that as a rule it is only during the search for the cause of their troubles that the infection is discovered Fever may be absent or very slight in such children, and apart from the general lassitude and malaise with anorexia and some pallor there are no definite symptoms The subacute cases generally occur among children who show periodic exacerbations of a latent infection recurrent upsets which may appear with attacks of vomiting simulating cyclical vomiting or periodic bouts of fever the cause of which remains obscure until pus and *B coli* are found in the urine

Treatment

The general rule is that patients having acute symptoms do well at all ages under strict treatment, but a certain number of those affected either fail to respond at all or only respond moderately well and gradually fall into the subacute or chronic groups In the less acute groups the cure is much more difficult and treatment has to be more prolonged In some instances the most painstaking treatment seems to be utterly unavailing and nothing has the slightest effect upon the urine for the bacilluria persists unchanged in spite of every form of therapy Some cases show evidence of renal damage, such as the presence of casts in the urinary deposit, a raised blood urea, or a poor urea concentration test In such cases the prognosis is not at all good, for sooner or later they develop signs of renal inadequacy or cardio-vascular damage

There seem to be three important requisites in the successful treatment of all cases needless to say the earlier the diagnosis is made and correct treatment commenced the better the outlook The first requisite is rest in bed until the condition of the urine is normal Children generally relapse if allowed to get up and run about before bacilli are completely abolished from the urine They may relapse after the urine has become normal, but are certainly less likely to do so if kept at rest until it has become free from bacteria The second requisite is alkali, this should be given in plentiful doses as sodium bicarbonate or potassium citrate These drugs are not palatable, and should be made at least tolerable by the addition of syrup and some flavouring agent The bicarbonate may also be added to drinks, and the citrate given in moderate quantity in home-made lemonade is not objectionable No degree of alkalinization can completely inhibit the growth of *B coli* in the urine since the organism will grow in a more alkaline urine than the kidney can excrete Wright states that *B coli* grow in urine of *p*H 9 0, and the most alkaline urine the kidney can excrete has a *p*H of 8 6 For some years I have been in the habit of maintaining a constantly varying *p*H of the urine by alternating alkaline and acid medication The alkalis are given in as large doses as the child will tolerate until the urine is definitely alkaline then a mixture containing hexamine and acid sodium phosphate is used until the urine becomes acid, at which point alkalis are again exhibited This treatment has the advantage not only of discouraging the colon bacillus but also of diminishing other urinary organisms I do not place any great faith in hexamine but prolonged usage has given it some reputation and it seldom does harm The third point in treatment is the flushing of the kidney by a large fluid intake Fortunately most of the small patients are eager to drink, and this readiness should be used to give as large a quantity of fluid as possible even a small child should take fifty to sixty ounces of fluid a day and more can sometimes be given Various urinary antiseptics are recommended hexamine salol, and hexyl-resorcinol are those most commonly taken by the mouth, while the usual lengthy list of antiseptics may be tried locally Good results seldom follow such measures Vaccines occasionally seem to be useful but far more often prove disappointing

The chronic case and the recurrent case present special difficulties in treatment and it is still an open question how far one ought to go in attempting to eradicate the infection McKann writing in the *American Journal of Diseases of Children* points out that 20 per cent of children with chronic pyuria show some abnormality of the urinary tract The most common deviation from the normal are dilatation of the ureters or kidney pelvis and kinking or doubling of the ureter on one or both sides He suggests that these abnormalities have a special relationship to urinary infection such that the abnormality either predisposes the tract to infection or that a fortuitous infection persists because of the abnormality Bigler, in 153 consecutive post-mortem examinations of children in which particular attention was paid to the urinary tract found no less than 13 per cent of abnormalities Curiously enough the commonest abnormality was ureteral narrowing or obstruction which occurred in 11 cases In this series of 20 cases only four patients died as a result of urinary tract infection and as the eldest of these was only 6 weeks old congenital abnormalities can hardly be said to have played a large part in predisposing to urinary infection in this series On the other hand there is no definite evidence here for or against the suggestion that abnormalities favour the persistence of acquired infections In the present state of our knowledge, then it is essential that every effort should be made to discover any abnormality of the urinary tract in any case of chronic or subacute pyelitis in order that the abnormality may be corrected if possible or the prognosis modified accordingly

A child with recurring attacks of pyuria who has a double dilated ureter and kidney pelvis can only be regarded as most seriously ill On the other hand a single hydronephrosis with a double ureter, provided that the sound kidney is functioning normally can be treated surgically with a reasonably good hope of a definite cure It is therefore advisable to have a cystogram taken in all chronic cases, and to make a cystoscopic examination in such as are unsatisfactory or doubtful as well as in the definitely abnormal Pyuria is often associated with bowel infections and occasionally with a chronically inflamed appendix These conditions should receive appropriate treatment

Pathology of the Condition

Interesting pathological studies have been published by Chown and by Wilson and Schloss their papers being the result of post-mortem examination of children with urinary tract infections Chown's paper was based on material collected at Johns Hopkins Hospital for the years 1911 to 1924, and deals with 29 cases Wilson and Schloss took twelve years to collect the 49 cases on which their base their paper These details are of some importance since we are not told the number of clinical cases which produced the pathological material The conclusions reached in both papers are similar—namely that pyelitis is a misnomer that pyuria is due to an interstitial suppurative nephritis, and that careful examination of the kidney pelvis generally fails to show any evidence of pyelitis

The types of cases studied by these authors are identical and are instances of severe septicaemic conditions In Wilson and Schloss's paper there are no fewer than 7 cases of meningitis 14 of pneumonia 3 with empyema 2 with otitis media 11 of acute infective enteritis and many of the cases combine one or more of the above condition These cases are obviously general blood infections of the most severe nature It is doubtful if the *B coli* which appeared in the urine was the original invading organism and indeed it seems probable that the organism was a secondary invader if it ever reached the blood stream The same may be said of those somewhat uncommon and most curious cases of pyelitis associated with jaundice reported by Gorter and Lignac

Helmholz has done some extremely interesting experimental work with rabbits He finds that spontaneous *B coli* infection of the urinary tract occurs in these animals that the bladder is primarily infected and hence the rest may be an extension of the infection producing a pyelitis or pyelonephritis On the other hand if colon bacilli are injected into the blood an entirely different pathological picture appears for under these conditions kidney abscesses may result, the bacilli being found equally distributed through both ureters and the bladder He finds that the bladder is never infected unless the ureters

are infected, the ureters are never free from *B coli* if the bladder is infected In the spontaneous infections, by tying off the bladder and ureters separately, Helmholz has shown that the bladder is often infected, while one or both ureters are free from infection, and that although pyelitis and pyelonephritis may appear, kidney abscesses do not occur in the spontaneous infection

It seems worth while to turn from the consideration of children to review briefly *B coli* urinary infections in adults After puberty such infections are far less common than in childhood, and a marked disproportion exists between the sexes In men, apart from calculus, prostatic abnormalities, and urethral stricture, *B coli* infections of the bladder or ureters are rare In women, on the other hand, the *B coli* infection is by no means uncommon The associated conditions are pregnancy, gynaecological operations, the trauma of the honeymoon, and long periods of retention such as may occur on long car or railway journeys

Further, such infections—provided that the infecting organism is the *B coli* only—produce but little upset, and are probably frequently missed The facts of this brief statement seem to point very definitely to an ascending rather than to a blood infection, and support the clinical finding of children's physicians that pyelitis is generally an ascending infection with a correspondingly greater incidence in girls If these infections (*B coli*) were blood-borne, then men would be not less susceptible than women, and evidence of disturbance in other organs of the body would be common and not infrequently severe

Certain figures have been obtained from the Children's Hospital in Birmingham Starting from the year 1925 117 consecutive and unselected cases of pyelitis were taken with the object of tracing the children, re-examining them, and determining as far as possible their present condition In this way it is hoped to throw some light on the etiology of the condition

Age	No	Male	Female	Average Age	Acute Cases	Died
0 to 2 years	47	7	40	1½ years	33	7
2 to 12 years	70	18	52	6½ years*	31	2

* The average age among boys was 7¼ years

Of the seven deaths that occurred during the first two years all were in girls Three were cases of pyelonephritis, one had kidney abscesses, one pneumococcal septicaemia, one infection of a congenital hydronephrosis, and one pyelonephritis and thrombosis of the left renal vein This death rate (9 in 117 cases) is 7·7 per cent, or 3 per cent in patients over 2 years of age It must be remembered that these figures are taken from those ill enough to be admitted to a hospital, which suggests that many milder cases occur which do not need admission, and that therefore this is a higher death rate than the real mortality of all cases of pyelitis On the other hand, several of the chronic cases showed evidence of nephritis while in hospital—the presence of tube casts in the urine, raised blood urea, or a poor urea concentration capacity The cases in the above series are being followed up to determine the present condition of the children It is proposed to examine the urine, the renal function, and the cardio-vascular systems

Conclusions

As a clinician I am familiar with a *B coli* infection of the urine, a condition which is frequent in children, commoner in girls than in boys, appearing in acute, chronic, and recurrent forms, but which is relatively seldom fatal This condition has been called pyelitis, and although I am not in a position to prove that it is always a pyelitis, I feel that I can prove that it is not always part of a septicaemia or evidence of a nephritis

It seems that the pathologist has experience only of a selected group of patients out of the many who have *B coli* infections of the urinary tract—the more severe cases which are septicaemias, and in which the colon bacillus is seldom if ever the primary infecting organism It is hardly likely that a severe septicaemic condition in children, with renal infection and possibly abscess formation, could have a mortality as low as 3 per cent after the age of 2, and it is significant that the collection of 78 post-mortem records took no less than twelve years at two large children's hospitals, whereas, clinically, *B coli* infections are common

I am deeply indebted to Dr A V Neale for the work he has done in following up cases and in getting out the original figures for cases of pyelitis at the Children's Hospital, Birmingham

BY

DAVID NABARRO, M D, F R C P,

DIRECTOR OF THE PATHOLOGICAL DEPARTMENT, HOSPITAL FOR SICK CHILDREN, GREAT ORMOND STREET

IT is a curious coincidence that just twenty years ago, at the seventy-eighth Annual Meeting of this Association, held in London in 1910, one of the subjects for discussion was "Infections of the urinary tract by *Bacillus coli* in infancy and childhood"[1] Whether it was by accident or by design that the subject of the present discussion, "*B coli* infections in infancy and childhood," was chosen I do not know, but it will be of interest to compare the views prevalent in 1910 with those current to-day—twenty years after It is perhaps significant that, whereas in 1910 the discussion was opened by a physician (Dr Box) and a surgeon (Mr Paidoe), this year the duty has been entrusted to a physician and a pathologist, which may be interpreted to mean that to-day the pathologist is called upon to take a larger share in the diagnosis than was formerly the case, but there is no doubt that the urological specialist can help very materially by cystoscopic examination and ureteric catheterization in clearing up these occasionally obscure cases

One of the most commonly recognized diseases of infancy and childhood, which is generally held to be due to, or to be associated with, the *B coli* in the majority of cases, is pyelitis, and it is a coincidence that Escherich, who discovered and named the *B coli communis* in 1885, is generally credited with having introduced the concept "pyelitis" as a clinical entity into paediatrics in 1895 This statement is from Chown's paper—"Pyelitis in infancy"[2]—but, as Chown points out, Escherich's cases of pyuria occurred in older girls, from 7 to 9 years of age, and were not cases of the so called pyelitis of infancy which are held to occur with greatest frequency in children of under 2 years of age It was Finkelstein who in 1896 drew attention to the condition in infants, and who concluded from his observations that the lesion was a primary pyelitis From that time onwards the existence of a primary pyelitis has been recognized by clinicians, and has gone unchallenged until recent years There is no doubt about an infection of the urinary tract of which patho-

* Read in opening a discussion in the Section of Diseases of Children at the Annual Meeting of the British Medical Association, Winnipeg 1930.

logical evidence can be obtained by examination of the urine, further, there is no doubt that the causal organism of the infection is the *B coli in the majority of the cases*, but there is little direct evidence, apparently that the lesion is primarily an inflammation of the renal pelvis, and probably it starts as an interstitial nephritis

There are many interesting topics here for consideration and discussion, but I can only refer to some of them

Pathogenicity of B Coli

How comes it that the *B coli*, which is a normal and saprophytic inhabitant of the big bowel from the earliest days of extrauterine life, can become pathogenic?

One is reminded of the well known definition of 'dust' as "matter in the wrong place" When the *B coli* gets into the wrong place (that is to say, when it leaves the colon) it may take on noxious or pathogenic properties I need scarcely remind you that *B coli* has active fermentative powers on sugars alcohols, etc, and in particular that it ferments lactose with the production of acid and gas the pathogenic intestinal organisms such as the *B typhosus B paratyphosus* A, B and C, the Shiga Flexner dysentery group of bacteria on the other hand do not ferment lactose and are hence known as non lactose fermenters W J Wilson[3] has recently written as follows

> There is something more than chance behind the fact that the majority of the pathogenic races of the *coli* typhoid group of bacteria are unable to ferment lactose When a micro-organism becomes so definitely pathogenic as to be the causal micro-organism in a definite disease its cultural and perhaps to a less degree its serological characters become fixed In the case of the *B coli group* the members of which are more saprophytic than parasitic there is great variation in their action on sugars and also serologically'

I am personally not in agreement with this opinion, I hold the view that the cultural characters of an organism do not become fixed, but may undergo evolutionary changes, such as occur with all living things and in the case of bacteria these changes may happen in a comparatively short space of time To revert to the *B coli* and its change from a non-pathogenic to a pathogenic condition. Normally in the bowel it is a harmless saprophyte, but in certain inflammations of the intestine the *B coli* has been credited, rightly or wrongly with a pathogenic role, as in cases of *infective enteritis*, and it may certainly give rise to cholangitis and cholecystitis, as well as to appendicitis, pelvic and abdominal abscesses, and to infections of the kidneys and urinary tract In specific infections such as typhoid and dysentery the *B coli* at times seems to acquire pathogenic properties, increasing the severity of the infection or giving rise to complications Can it be that these various pathological conditions are due to different strains of the *coli* group of organisms? For example, the *B coli communior* of Durham ferments saccharose, while the ordinary *B coli* does not, the *B lactis aerogenes* is non-motile and produces a mucoid growth on agar and differs from *B coli communis* in other respects Then again it has been known for a considerable time that certain strains of *B coli* are haemolytic, while others are not Dudgeon, Wordley, and Bartree[4] in 1921 and 1922 made an extensive study of *B coli* infections of the urinary tract in relation to haemolytic organisms Among their conclusions these observers state

1. Two types of *B coli* are met with in urinary infections—haemolytic and non-haemolytic The haemolytic is much commoner in infections in the male (72 per cent) and the non-haemolytic in the female (70 per cent) but as very few children are included in the total of 162 cases studied it would be of interest to find out whether similar results would be obtained in coli infections in children

2. It was unusual to obtain both these types of *B coli* associated in any particular case or for a haemolytic infection to be followed by a non haemolytic or vice versa

3 Haemolytic *B coli* occur in the normal stools of adults and children but with increased frequency in cases of diarrhoea and colitis No evidence was obtained however of direct relationship between the urinary and intestinal haemolytic *B coli* in any particular case.

4 Few positive blood cultures were obtained and in no case was a haemolytic *B coli* obtained from the blood stream in a human subject

5 Living colon bacilli haemolytic and non haemolytic were inoculated in o rabbits without serious ill-effect and [illegible] were not obtained although various strains of urinary and faecal *B coli* were used

6 Some normal blood serums agglutinated *B coli* antigen but a much higher percentage of positive result was obtained with the serums of *coli* cases

Infection of Urinary Passages

Along which route or routes does *B coli* travel from its normal habitat to the urinary passages? There are three possible routes (1) directly via the urethra, (2) via the blood stream, (3) via the lymphatics Let us examine briefly the evidence found for and against these

The Urethral Route

For many years it was held that the infection was an ascending one via the urethra, and the fact that girls suffer much more frequently than boys lends support to this thesis Box, in 1910 adopted this view, of 107 cases to which he refers, 85 occurred in girls—a proportion of nearly 4 to 1 It is a prevalent belief that the so-called pyelitis of infants affects baby girls almost exclusively Chown, Wilson and Schloss,[5] and others, maintain that the disease does not affect little girls so preponderatingly as is generally held, and among the possible sources of error which are doubtless sometimes overlooked are a catarrhal vaginitis itself secondary to some acute febrile condition a specific vaginitis which is usually associated with a urethritis, contamination of the urine with faecal matter, and non-specific vulvo-vaginitis due to worms or some other cause Chown mentions the first three of these possible sources of error and I have myself seen all four operative in different cases

Blood-borne Infections

With regard to infection via the blood stream several years ago I made blood cultures of a number of cases of pyuria and bacilluria in older children with negative results Helmholz and his co-workers have made extended investigation on the filtering action of the kidneys after the intravenous injection of bacteria in a recent paper[6] he has given a summary of these investigations, with various conclusions deducible from them He was able to produce pyelitis in rabbits by both haematogenous and ascending infection so that his experiments are not of much value in determining the probable mode of infection in infancy He found that bacilluria induced by the intravenous injection of colon bacilli does not as a rule, tend to become localized to the bladder once the infection has disappeared from the upper urinary passages Many laboratory rabbits were found to have a spontaneous bacilluria and his observations led him to conclude that in the rabbit the infection is of the ascending type He is of the opinion that in children infections with the colon bacillus take place in the same way

Bugbee on the other hand does not agree that the infection in children is mainly of the ascending type but that as in adults there are two types or infection—namely those in which there is no urinary stasis and others in which a lesion is present which interferes with complete drainage In the type of case without urinary stasis the colon bacillus is the causal organism which Bugbee thinks is produced in very large numbers owing to some intestinal disturbance and then gets to the kidneys via the blood stream The majority of these acute infection[s] clear up rapidly especially if the gastro-intestinal tract is treated at the same time as the renal condition but if they do not and especially if they tend to become chronic or [illegible] investigations should be carried out Wilson and Scholes in their paper already referred to state that the main argument in favour of an ascending infection is the greater frequency of pyelitis in females, but in their series of cases, as in Chown's the difference in favour of females is not so great as it is usually stated to be The anatomical lesions

they describe in the kidneys, which will be referred to later, rather favour a blood-borne infection They also quote Brewer,[8] who, on clinical and experimental evidence, showed that ascending infections of the kidneys always arose from obstruction and stasis In such cases the inflammation was not confined to the kidney tissue, but involved also the ureters and pelvis

The Lymphatic Route

The third possible mode of infection is via the lymphatics In order to explain the more frequent occurrence of right-sided lesions, Franke suggested a direct lymphatic extension from the caecum Chown questions the tenability of this hypothesis, and suggests the possibility of the weight of an enlarged liver pressing on the right kidney, which might lead to stasis and so to increased permeability of the kidney should a bacteriaemia be present Whereas Chown's acute or subacute cases show the frequency of bilateral renal involvement with a tendency to more severe lesions on the right side, John Fraser of Edinburgh found a great frequency on the left side, which he explained by direct extension from the overlying colon Another view is that the infection of the bladder may be direct (in girls), and that it reaches the kidney via the peri-ureteral lymphatics

PATHOLOGY OF THE DISEASE

With regard to the pathological anatomy of the malady, it was originally thought to be a cystitis (Escherich) or a primary pyelitis, with later on a possible involvement of the kidneys (Finkelstein and others) In 1910 Jeffreys,[9] Thiemich,[10] and Forbes[11] all reported cases in which suppurative lesions were present in the kidneys, with, in some cases, a normal pelvic mucous membrane Forbes describes two post-mortem examinations on infants with pyelitis, aged 4 and 7 months respectively, who had suffered from diarrhoea and vomiting He regards these as primarily gastro-intestinal infections, later giving rise to general systemic infection including the pelves of the kidneys and a descending infection of the urinary tract In two other cases with enlarged kidney in which operations were performed, abscesses were found in the kidney substance

More recently, Chown, Wilson and Schloss, Bugbee, Helmholz, and others have emphasized the fact that the commonest lesion in the type of case under consideration is a diffuse interstitial nephritis which may give rise to suppurative foci of varying size, pyelitis may at times be present in addition, and rarely a cystitis This diffuse nephritis would explain the tenderness and pain which is sometimes present in these cases, and which is probably greater than a simple pyelitis could produce It is therefore more correct to call the condition pyelonephritis than a simple pyelitis

BACTERIOLOGY

As regards the bacteriology of the condition, there is no doubt that the organism most frequently isolated from the urine in these cases is the *B coli communis*, either alone or associated with *B proteus* or streptococcus, these organisms may rarely be present alone Other organisms I have encountered in the urine of these patients are *B lactis aerogenes, B pyocyaneus, B coli anaerogenes* (this in the light of subsequent knowledge was probably a Sonne dysentery bacillus), a Shiga-like bacillus, *B faecalis alkaligenes*, and staphylococci The very fact that such a variety of organisms may be isolated from the urine raises a doubt whether these are the actual cause of the disease or merely secondary invaders Certainly in a number of cases the disease appears to follow an intestinal upset and to present itself to the physician in the guise of an acute infection somewhat like a typhoid or paratyphoid fever This may possibly be the stage of bacteriaemia, and it may be that during the process of eliminating the bacteria the kidneys develop the condition clinically known as "pyelitis" Perhaps some anatomical abnormality may be a contributing factor even in the patients who rapidly get well, it is certainly a cause of some of the cases of so-called chronic pyelitis or of a persistent or intermittent pyuria Dr Woolstein in 4,900 post-mortem examinations found congenital anomalies of the urinary tract in 117 (2·5 per cent) Dr Sheldon, registrar at the Great Ormond Street Hospital, has kindly analysed for me 400 recent consecutive post-mortem examinations, with the result that 10 showed similar congenital abnormalities—again a percentage of 2·5 My colleague Mr Oswald Addison, who has for many years made a special study of genito-urinary disease in children, has kindly given me permission to quote some of his cases

CASE I

One of these was a girl, aged 11 years, who was admitted to the Children's Hospital on account of pain in the right loin of three days' duration She had had nine similar attacks since she was 6 years old The urine was acid, and contained many pus cells and *B coli* On cystoscopic examination there was a slight basal cystitis, the right ureter was red and oedematous, the left normal Some weeks later pyelography showed the appearance of hydronephrosis on the right side, and at operation an aberrant artery was found running across the front of the renal pelvis This was ligatured and divided, with the result that when seen three months later the child had had no recurrence of her symptoms, and a catheter specimen of the urine was sterile

CASE II

A similar case, that of a girl aged 8 years, was in Great Ormond Street Hospital under the care of Dr Hutchison in 1923 She had attacks of renal colic complicating a hydronephrosis At the first investigation the urine was sterile, but nine days later streptococci were present but no pus At operation an aberrant vessel found running across the middle of the pelvis was ligatured and divided as in the previous case Several years later a pyelogram revealed the hydronephrosis as large as it was at the operation, but the child had had no more attacks of colic, and the urine was sterile

CASE III

Another case of Mr Addison's was that of a girl with three years' history of acute right-sided colic A hydronephrosis was present, with pus cells and *B coli* in the urine At operation an aberrant artery was found running across the ureter about half an inch below its pelvic orifice to the lower pole of the kidney This was divided, and eighteen months later there were no symptoms and the urine was sterile

Another group of cases in which at different times a diagnosis of pyelitis, renal infantilism, or idiopathic dilatation of the ureters was made has been shown to be due to the presence of a valve-like fold of mucous membrane in the prostatic urethra, resulting in obstruction to the normal outflow of urine Young, Frontz, and Baldwin[12] were the first to draw particular attention to the existence and the effects of this abnormality, and recently Drs Poynton and Sheldon, in a paper entitled "Dilatation of the bladder and ureters in childhood,"[13] have reported a series of 24 cases, many of them with pyuria and infection, in which hypertrophy of the verumontanum, a urethral "valve," or some other congenital abnormality was at the root of the trouble They point out that the true state of affairs may be easily overlooked if the whole genito-urinary tract is not removed *in toto* and subsequently carefully dissected out Lastly, it should be remembered that an abnormality, such as a dilated ureter, may be unilateral

TREATMENT

Dr Wilkinson has made adequate reference to the treatment of these cases, so there will be only a few points, mainly of a bacteriological nature, to which I need refer As is well known, these cases do well if given plenty of fluid to drink and if the urine is made and kept alkaline This treatment, however, does not always clear up the condition of bacilluria, which can then sometimes be made to respond to alternations of reaction in the urine The sudden transition from a very alkaline to an acid urine will sometimes clear micro-organisms from a urine when the previous treatment with a urine alkalizer has failed Urinary antiseptics are sometimes given, it must be remembered that hexamine will act only in an acid urine It is possible that when this drug is being administered many organisms may still be present in the urine but fail to grow on culture, this may be because they are dead or perhaps only

inhibited by the antiseptic present At a discussion on the treatment of pyuria in children, held at the Royal Society of Medicine in 1927, Drs Hare, Lepper, and Martland[11] gave an account of work they had done on the reaction of the urine in relation to the treatment of *B coli* infections with alkalis and with hexamine These observers found that although the administration of alkalis relieves the symptoms, the patients are not cured thereby, for the alkalis have no lethal effect on the bacteria, nor do they act by neutralizing an acidosis They alter the hydrogen-ion concentration of the urine which may act beneficially in one of two ways (1) the alkaline urine may be less irritating to inflamed surfaces than an acid one, (2) the hydrogen ion concentration may be an important factor in determining the rate and force of the muscular contractions by which urine is propelled from the pelvis and the kidney to the bladder

Hexamine, as is generally known, acts as a urinary antiseptic by breaking down into formaldehyde which is lethal to coliform bacilli Two factors are of importance in connexion with hexamine treatment—namely the secretion of an acid urine, and the relative vulnerability of the invading bacillus to formaldehyde Drs Hare, Lepper and Martland found that the greatest concentration of formaldehyde in the urine of their cases was 1 in 20,000, whereas anything less than 1 in 5,000 is said not to be bactericidal On studying twelve strains of *B coli*, however, they found considerable variation in the susceptibility of the action of formaldehyde on the bacilli, and, further, that it was only when the *p*H of the urine had fallen to 4 that effective doses of formaldehyde were liberated in the urine It appeared that small doses of hexamine were preferible to large ones, as the former caused less alteration in the *p*H, and that considerably more formaldehyde was liberated at body heat than at the room temperature

Drs Hare, Lepper, and Martland also draw attention to the fact that the ordinary routine adopted in collecting and testing the reaction of the urine is misleading in this connexion Litmus is not a good indicator because it turns blue at *p*H 6 6 at which acid reaction symptoms are not relieved The urine should be collected in a stoppered bottle under toluene (to prevent decomposition and loss of CO_2), and should have the *p*H tested with phenol red in an ordinary comparator box One should perhaps add that all these observations were made upon adult patients, but there is no apparent reason why the results should not be applicable to children

The value of vaccine treatment in these cases seems to be subject to a good deal of difference of opinion Twenty years ago Dr Box said that it was of no value, yet at the same meeting Dr Forbes said that three out of four of his cases were benefited by vaccine treatment Many clinicians are inclined to agree with Box in thinking that vaccines are not of very much value Personally I believe that cases of a true infection, in which there is a reaction and the consequent presence of pus in the urine, are often benefited by a vaccine, while simple cases of bacilluria do not appear to respond so well to this treatment Perhaps I may be permitted to quote a few remarks I made at a discussion held in 1914 at the Royal Society of Medicine on vaccines from the standpoint of the physician

> I referred to a patient of Dr Pownton and Mr Fairbank a baby girl about 1 year of age who was profoundly ill from some urinary tract infection The kidneys were considerably enlarged and the case was regarded as one of pyelonephritis There were many pus cells and organisms in the urine and on culture three different intestinal organisms were isolated The child appeared to be dying and permission was given to try a vaccine This had already been prepared from all three organisms in case it might be called for and four injections in all were given Already after the first injection the child's condition began to improve and she was shortly afterward discharged from hospital looking the picture of health but with still a few pus cells and organisms in the urine

A point in connexion with vaccine treatment to which I referred in my paper of 1914 is that the urine should be culturally examined from time to time in order to ascertain if the same organism is present I can recall a case in which four different organisms were isolated from the urine of a child at different times during the course of one year These were a *B coli* and a [illegible] probably this was what we now call the Sonne dysentery bacillus—streptococci *B proteus*, and *B coli* [illegible] an autogenous vaccine appeared to clear the urine from the particular organism present at the time

Another point to remember in treatment is that sometimes the infection will clear up either spontaneously or as the result of treatment only to recur after a variable interval In these chronic and recurrent cases some mechanical obstruction to the flow of urine or blood should be looked for and will then probably be found If the cause can be dealt with as in the cases to which I have referred the condition may be permanently remedied.

A line of treatment which holds out a certain amount of promise, but which so far as I know has not been given much of a trial by English speaking physicians, is that by bacteriophage Further if it is a fact that a disordered condition of the bowel with the presence of an excessive number of *B coli*, or of *B coli* of an exalted virulence, is coincident with a prelitis or a pyelonephritis then attention should be directed to the bowels, which should be kept well oiled with liquid paraffin

CONCLUSION

Infections with *B coli* in children are by no means rare, they often get well spontaneously, at other times they become chronic or tend to recur Investigations should be made upon the properties of the organisms present as regards haemolytic power, serology, etc, to discover if these have any bearing on the clinical condition In the chronic and recurring cases cystoscopy, pyelography and if necessary catheterization of the ureter, should be carried out in order to ascertain if there is any abnormality present to account for the clinical condition

These surgical procedures should not be so long delayed that the child's kidneys are found to be irreparably damaged when the biochemist makes an investigation of the blood urea and of the renal function It will be deduced, therefore, from the foregoing observations that I am in agreement with Mr George Waugh a former colleague at the Great Ormond Street Hospital who stated in 1927[12] that every case of urinary tract infection should be investigated by a team of four—a physician a surgeon, a bacteriologist, and a biochemist—though personally I should include a radiologist and if the patient should unfortunately die, then also a pathologist to hunt carefully for anatomical abnormalities If this were always done these cases would be more thoroughly and systematically investigated than in the past, and the results would be better than have hitherto been obtained

I should like to express my thanks to my colleagues at the Hospital for Sick Children for permission to refer to the notes of their cases to Dr W P Sheldon for examining the post-mortem records and obtaining the figures for the incidence of anatomical abnormalities and to Mr Derrick Martin for his assistance with specimens and for preparing the lantern slides

THE LABORATORY IN A SCHEME OF PREVENTIVE MEDICINE*

BY

W G WILLOUGHBY, M D, D P H,

MEDICAL OFFICER OF HEALTH AND SCHOOL MEDICAL OFFICER, EASTBOURNE

THE use of the laboratory in the diagnosis, prognosis, and treatment of disease, and in investigations of circumstances, such as food and water supplies, involving the health and comfort of the individual and of the public, has steadily increased in recent years Chemical and bacteriological work in connexion with examinations of milk and other foods, water, rivers, sewage effluents, etc, has become a regular part of the scheme of preventive medicine, and public analysts are among the regular officials of a Public Health Authority The position with regard to human pathology is not so defined, and varies very much in different localities

From its earliest days, and even then in its limited range, the Public Health Service has been particularly concerned with the prevention of infectious disease It was natural, therefore, that with successive discoveries in the bacteriology and pathology of the infectious diseases, an increasing need for laboratory work in connexion with the Public Health Department should have been felt

The Public Health Service has developed from being concerned mainly with the environment of the public into a more personal relationship with the individual in all forms of ill-health—not merely in a limited number of infectious illnesses The need for the frequent and systematic aid supplied by the laboratory has grown correspondingly, and there are no Public Health Departments in this country without some arrangements more or less complete for this important purpose

In the interest of individual and public health laboratory assistance should be systematized and made available for all persons for whom it may be required, not merely for those coming directly within the province of the Public Health Department in other ways It is difficult to see how this could be arranged without the aid of the Public Health Department This is shown by the frequent applications made to the department by medical practitioners for laboratory assistance, especially in the case of those patients unable to pay fees for the work done While necessary in these cases, practitioners also find it convenient that in other cases the arrangements should be made by a central authority This should not interfere with, but rather assist, the practice of specialists in pathology The Public Health Authorities can avail themselves of practising pathologists, in the majority of cases this is the best and most convenient system, the function of the Public Health Authority being on the whole limited to seeing that such a service is available for everyone and that payment is made according to means

It may be necessary occasionally that the Public Health Authority should itself supply pathological aid as well as provide for systematic assistance Examinations for diphtheria and tubercle bacilli are often carried out with advantage directly by the officers of local authorities The practitioners of a district find it very convenient to have these examinations performed locally, and to have arrangements made for receiving specimens at any time of the day or night

In large cities the problem of systematizing laboratory aid is an easy one Either a university, medical school, or laboratory attached to a large hospital, may be the centre at which the work is carried out, not only for the city itself, but for a large area around it If there are specialists in the subject practising in the district, their services can be used There are also excellent pathological institutes for carrying out the work A systematic scale of fees can be arranged, outfits for taking the various specimens can be sent out, and the full time of the pathologist and his assistants can be occupied Expert pathologists are always to be found in large centres of population

In rural districts the problem is more difficult, although in countries so thickly populated as England and with such convenient means of transport, there is little extra practical difficulty in using the large centres for most of the work, this is usually done

There are comparatively few instances where laboratory aid for diagnosis, prognosis, or treatment is so urgent that this convenient and economical method of using large centres would lead to serious difficulty Unless time is very pressing, there are distinct advantages in using a large laboratory where not only the experience of experts can be drawn upon, but also where students can profit by laboratory work on problems which will arise later in private practice

When the public service and public funds of a local authority are involved, it is advisable, I think, to limit the pathological and bacteriological aid to essential work necessary for public and personal health Experimental research comes under a different category, and although it ought to be encouraged, it cannot as a rule be considered to be within the scope of the ordinary duties of local authorities

Specimens forwarded for examination through a local authority should generally be sent for a definite object, not in a vague hope that the laboratory can take the place of a careful examination of the patient and in this way supply a clue Without underrating the value of laboratory aids in diagnosis, prognosis, and treatment, I deprecate the tendency to rely on them to the exclusion of thorough personal examination and clinical methods Too much dependence on laboratory aid leads to lack of care in other methods concerned with the personality of the patient and destroys that careful investigation which should be so useful in every form of illness The laboratory should be relied on to assist or confirm diagnosis rather than to make it In diphtheria, for instance, where immediate specific treatment by antitoxin is so valuable, I have come across cases in which the delay caused by waiting for a laboratory result of a throat swabbing has seriously prejudiced the chance of recovery In most cases diphtheria can be diagnosed without laboratory aid, and early treatment is so important that in probable cases the antitoxin treatment should not be delayed for a bacteriological result

Another important point is that a negative pathological finding may lead to omission of specific treatment, which would be against the public and personal interest This is occasionally found in cases of diphtheria, in which for various reasons, such as the previous use of antiseptics, or omission to take rubbings of both nose and throat, a negative result may be obtained where definite infection exists

During the war I had an interesting example of how bacteriological investigation may cause considerable unnecessary inconvenience On one of the fronts, most of a unit was held up for what was described as an outbreak of diphtheria, there being many positive cases reported from the pathological laboratory On examining the men concerned, I was very doubtful of the diagnoses, and visited the laboratory, where I found that none of the cases really showed true diphtheria bacilli, but only diphtheroids In other diseases besides diphtheria I have known of incorrect laboratory reports causing considerable inconvenience

In spite of these drawbacks, however, the enormous value of pathological investigation makes its systematization essential, and as the Public Health Departments are bound to be the starting points of this work for the poorer section of the community, it must apparently be systematized in the Department of the Public Health Service

Quite as important as the pathological investigation itself is the ability of clinicians to interpret pathological findings One of the important reasons for the employment of the best pathologists is that they can frequently assist the clinician in the interpretation of results

From the public health point of view, the pathological laboratory will generally be most commonly used for diagnosis with a view to proper treatment, another branch of its work, however, is the preparation of autogenous vaccines As far as my experience goes, the number of applications for autogenous vaccines made by medical practitioners for their patients has recently decreased

The provision of laboratory assistance by Public Health Authorities, beyond chemical and bacteriological work by the public analyst, has so far been more or less limited to cases of infectious illnesses, including venereal diseases and

*Read in opening a discussion in the Section of Preventive Medicine at the Annual Meeting of the British Medical Association, Winnipeg, 1930.

tuberculosis, and to a slowly growing extent in other departments, such as maternity and child welfare The rapid advance in pathological science in so many conditions not recognized in the past as coming within the direct purview of Public Health Authorities has clearly demonstrated that systematic centralized pathological aid should be within the reach of everyone, being essential to any complete scheme of preventive medicine

THE MANAGEMENT AND TREATMENT OF INCIPIENT CATARACT*

BY

L VERNON CARGILL, F R C S,

SENIOR OPHTHALMIC SURGEON KING'S COLLEGE HOSPITAL.

THE treatment of early cataract has always exercised the minds of ophthalmic surgeons, it is a matter of daily importance to us and our patients, and a very great deal has been written and said about it This is an opportune occasion for a renewal and exchange of our opinions and a confirmation or otherwise of our beliefs

Incipient cataract is a condition in which localized grey opacities have appeared in the lens during adult life, and for which there is no obvious constitutional or local cause, either injury or disease Such cases, for want of more precise knowledge, are usually labelled "senile cataract"

We might also include in our discussion the prodromal state preceding the development of actual opacity Here there is an appearance of varying spots and lines on mirror illumination at different angles, fundus details may appear distorted by irregular lental astigmatism, fundus illumination may be relatively poor, the pupil reflex greyish and a central dark circular zone may show on transmitted light These phenomena we know are due to the formation of fluid clefts between the cortical lens fibres and to nuclear sclerosis

In examining the lens I always employ the direct ophthalmoscopic method with +16 sph behind the aperture, and use the slit-lamp if necessary for further details On the discovery of lens changes we look for other accompanying senile ocular conditions such as vitreous degeneration, colloid bodies in the lamina vitrea, and macular or circumpapillary atrophy We eliminate such complicating eye diseases as uveitis, retinitis pigmentosa, and detached retina, in which the lens opacity is likely to take the form or a subcapsular rosette at the posterior pole We also exclude such special cataracts as "ray" cataract and those associated with dystrophia myotonica and parathyroid tetany

Some forty years ago it was the custom in cases of immature cataract for some ophthalmic surgeons to combine preliminary iridectomy with artificial maturation of the cataract according to Foerster's method The anterior chamber being emptied, the lens was massaged by rubbing the front of the cornea with a cataract spoon The object was to avoid extracting an unripe cataract Among these so-called "immature cases" there were probably many with useful vision which we should now classify as "incipient" The method was uncertain in its results, it did not affect the posterior cortex, it was liable to cause iritis rupture the anterior capsule, or subluxate the lens with resulting vitreous loss when extraction was performed It it unnecessary because we can extract immature cataracts successfully, and it is wrong because we cannot tell how slowly opacity will develop In a paper on "The prognosis of incipient cortical opacities of the lens," Jessop drew attention to cases of striated cataract in which progress was extremely slow, and which he thought might be described as "arcus senilis lentis" Speaking of the terror of progressive blindness which the word cataract implies in the minds of the laity he advanced the opinion that a surgeon would be perfectly justified in saying that these were not cases of cataract if the patient asked the question The case was cited of a patient who had 6/12 thirty years after being first told of cataract.

In this connexion the most striking fact, I think, in going through old records is the considerable number of patients over 60 years of age affected with incipient cataract, and yet the very small number of cases which reach the operative stage Many cases that I have been watching for from ten to twenty years, or longer, have still useful vision (6/12 or more), and many others that have died were still seeing well

Lens opacities are physiological in old age and may be compared to white hair, baldness, and wrinkled inelastic skin Old age is a relative term, it may be very premature or much deferred, and so we may find lens opacities acquired in middle age or even earlier This applies particularly to 'coronary" cataract which occurs frequently and may be found so early as to merit the term "presenile", its course may be so gradual as to seem almost stationary

It is our duty therefore, in cases of incipient cataract to avoid frightening our patients with the dreaded word 'cataract' when progress may be so slow and useful vision last so long Where there is no appreciable defect in vision, as in coronary, striated, or dotted cataract, nothing need be said, unless to a discreet relation or friend

With defective vision, perhaps progressively diminishing, as in the cuneiform and radial spoke forms of cataract and in posterior saucer shaped cataract, some explanation will be necessary, and then, as Story has remarked, it becomes a matter of "diagnosing and treating a patient, not a disease" With a sensible patient a true statement and clear explanation of the lens opacity, illustrated by a diagram or model, I have always found the best course With a highly nervous individual we should speak guardedly, as, for instance, of "cracks" or "flaws" in the lens, 'such as come to all with age" I know a patient who completely collapsed when told there was evidence of cataract in her eyes, and another, a nervous excitable woman who perpetually vowed eternal vengeance against an oculist who bluntly told her she had cataract many years before an operation was needed She suffered a life of apprehension from that day We must on no account make our cataract patients hypochondriacs and take all the hope out of their lives We should rather comfort them with a cheerful optimism It is dangerous to predict when operation will be necessary A patient who had been told by an eminent oculist that she would probably need an operation within five years was managing very well twenty years later with 6/9 and Jaeger 1 in one eye and 6/18 and Jaeger 8 in the other, and she was then 85 years old I could give other instances

As a matter of course we seek to obtain the best possible vision with optical corrections, and we may to some extent be retarding the disease by relieving accommodation strain We also retest periodically and alter our corrections according to the demands of a changing lental refraction hypermetropia may become less, myopia develop or increase and astigmatism may alter The use of Crookes's, fieuzal, or amber glasses in outdoor glare may help vision and protect the eyes from that radiant energy which is considered a fundamental predisposing factor in causing cataract As lenticular opacity develops we instruct the patient how to get the best results from illumination, more intense for marginal and less intense for central opacities, and we determine if a weak mydriatic is any help *Incidentally* we watch tension, and should it rise from a swelling lens iridectomy may need consideration *Reading vision* may be improved with extra power in the presbyopic glasses convergence for the nearer distance being relieved by prism The hand magnifier or the *reading screen* made by Hawes, may be helpful or both together and I have known Galilean spectacles useful but in such cases we are passing beyond the stage of incipient cataract

What guidance in dealing with cataracts do we derive from pathological studies and researches in to the constitution and properties of the lens? We know that the lens derives its nutrition entirely by endosmosis from the intraocular fluid This fluid may be affected by any abnormal or toxic state of the capillary blood from which it is derived, and changes in the permeability of the capillary walls will also affect its character, while changes in the permeability of the lens capsule or in the epithelium lining

*Read in opening a discussion in the Section of Ophthalmology at the Annual Meeting of the British Medical Association Winnipeg 1930

will affect the normal metabolic interchange between the fluid and the lens Changes in the ciliary epithelium, if it has a selective function, would also have their influence, but according to the latest researches the intraocular fluid is a "dialysate" from capillary blood, and passes into the eye direct from the vessel walls without the intermediation of ciliary epithelium, or glands of the ciliary body

According to Friedenwald's researches, the permeability of the lens capsule decreases with age, and metabolic processes may be thereby sufficiently obstructed to cause cortical cataract Defective metabolism may damage the vital capsular epithelium, causing degeneration and vacuolation, and it disturbs the delicate autoxidation process of cell metabolism within the lens, so that in cataract "glutathione," which is specifically concerned in the chemical defence of the body, entirely disappears According to Adams, in experimentally produced naphthalene cataract, which resembles senile subcapsular cataract, the cause appears to be a metabolic disturbance in the balance of the inorganic constituents of the body, and in these cases calcium oxalate crystals (like synchisis scintillans) were deposited in the posterior layers of the vitreous and on the surface of the retina The potassium in cataractous lenses is a tenth of that in normal lenses (Burdon Cooper), and the calcium is increased (Adams), but some experiments have not given results sufficiently definite to associate parathyroid deficiency with ordinary senile cataract (Pellathy) With age there is a decrease in the soluble lens proteins (α and β crystalline) while the insoluble proteins (albumin and albumoid) increase, and nuclear sclerosis, comparable to cuticular keratinization, increases in extent and degree When cataract develops there is hydrolysis and autolysis of lens fibres and coagulation of lens protein The problem is very complicated, but we are hoping to learn some day from the biochemist the exact nature of the physico-chemical processes of normal lens metabolism and the derangements which mark the onset of cataract But shall we ever be able to prevent cataract any more than senility and death?

It is evident that we have little to guide us in direct local medical treatment, and no treatment will remove actual opacity, for that represents the coagulation of lens protein and is "an irreversible chemical change" (Duke-Elder) I have no notes of any case in which definite lens opacities have disappeared Improved visual acuity in the course of a case must be due to other factors, changes in hydrolysis or metabolism, and in the intimate relationship of vacuoles, clefts, and transparent fibres It may in some cases be associated with better health, less near work, and a more restful life Dor, with the idea of causing lens dehydration, tried eye baths of calcium iodide (made by a solution of 1 per cent crystallized calcium chloride with 1 per cent desiccated sodium iodide) and reported retarded evolution, often for a long time But he also advised attention to stomach and teeth His method has been continued and its adoption extended in the form of ointments I have tried these methods, but never satisfied myself that they did much good Dionine has been tried for its lymphagogue effect Some use potassium iodide in drops or subconjunctivally, and this may be justified by the diminished potassium content of cataractous lenses Some reinforce local treatment with potassium iodide or iodine internally Van der Hoeve is said to have found that potassium iodide counteracts the swelling of the lens vesicles It is difficult to assess the value of such local treatment in a particular case, seeing that without it progress may be so slow and variable and that there may be periods of apparent improvement Prescribed with proper qualification it is a useful placebo, it comforts and satisfies certain patients that something is being done and helps to save them from unscrupulous quacks On the other hand there are others who are better without a daily reminder of their incipient cataracts

Smith eulogizes subconjunctival injections of neutral mercury cyanide (1 in 2,000 to 1 in 5,000) He thinks that the resulting intense hyperaemia of the ciliary body re-establishes normal metabolism He holds that it will cure 95 per cent of early cases, but agrees that it does not remove lens opacities It will be interesting to hear the experience of any who have tried this method Ionization, radium, x rays, electricity, and local radiation have all been tried without success, and some are likely to do more harm than good Lens antigen treatment has also proved useless The existence of incipient cataract may lead us to the discovery of some complicating constitutional dyscrasia, hormonal defect, or focal condition which needs treatment, and the removal or treatment of which may stay or retard the lenticular changes More good is likely to accrue in this indirect way than by any local medical treatment There may be general debility or premature senility needing investigation, diet and hygiene may need attention, or there may have been some debilitating disease Arterio-sclerosis may exist, and the condition of the blood vessels is of greater consequence than the pressure of the blood inside them The urine should be examined as a general rule, and always in developing cases Sugar may be discovered, and expert laboratory tests will then be required to determine if it is renal glycosuria and negligible, or whether there is mild or severe diabetes, the former requiring merely restriction of diet and the latter insulin

Cases of senile cataract with diminished sugar tolerance are indistinguishable from ordinary senile cataract and differ in slit-lamp appearances from true diabetic cataract In my experience, insulin treatment does not improve the lens condition appreciably, any more that it does the retinitis, although it may retard further changes, just as it prolongs life Albuminuria also demands a medical examination, and in advancing cataract it is usually wise to have the patient generally overhauled

We should not overlook evidences of endocrine deficiency and especially hypothyroidism The thyroid is the great regulator of metabolism, and any obvious deficiency should be suitably supplemented The function of the parathyroids is to destroy active waste products and regulate calcium appropriation, and by their power of stabilizing calcium in the blood they may check the tendency to the excessive lental calcium found in cataract If there is insufficient parathyroid hormone the blood cannot hold so much calcium in solution, hence its deposition in the lens among other tissues, it has been thought that this may have some connexion with the development of cataract. Parathormone has, however, proved disappointing in arresting senile cataract, and observations have been made which seem to show that lens changes in chronic parathyroid deficiency may be primarily of another nature, and the deposition of calcium salts quite secondary In parathyroid tetany the blood calcium falls to half the normal, whereas in ordinary cataract blood calcium is little affected However, Siegrist recommends the trial of a preparation containing thyroid, parathyroid, and testis with calcium lactate

As in some other eye affections it is, I think, of the greatest importance to eliminate chronic toxaemia and search for infective foci The toxins of streptococci and coliform bacilli are commonly the infective agents The teeth, tonsils, sinuses, gastro-intestinal and genito-urinary tracts, including the pelvic organs in women, should all be passed in review In the mouth, crowned teeth, dead teeth, and stumps should be looked on with suspicion, and as apical abscesses are more potent for evil than pyorrhoea, radiograms are advisable when there is any doubt I have seen cataract progress with unusual rapidity in the presence of dental sepsis In the young, lamellar cataract has been caused by prolonged septic infection (mastoid and cerebral abscess), and such a toxic condition is likely to have a detrimental effect on the nutritional osmosis of an unstable adult or senile lens, especially where the sepsis is bottled up in the body In elderly patients intestinal stasis, chronic constipation, and colitis are not uncommon, and should receive proper attention, and bacilluria should not be overlooked It is not only our duty to have all these matters attended to in pursuing the treatment of incipient cataract, but we are thereby improving the general health and well-being of the patient, and ensuring a condition of vitality and resistance which will promote the success of a future extraction, should it be needed

THE DIAGNOSIS OF CANCER OF THE LARYNX*

BY

EDWARD D. D. DAVIS, F.R.C.S.,

SURGEON NOSE, THROAT AND EAR DEPARTMENT, CHARING CROSS HOSPITAL.

EXTRINSIC laryngeal cancer or cancer of the pharynx which has extended to the larynx usually comes under observation so late that the diagnosis is obvious. These cases are generally seen by the laryngologist much too late for successful treatment either by operation or by radium, and earlier diagnosis is urgently needed. The problem of early diagnosis is intensified by the fact that cancer in itself does not produce any specific signs or symptoms, and it is only when the cancer cells form a tumour or ulcer that a series of mechanical symptoms and signs appear. These symptoms also develop slowly and insidiously, and it is unusual for the patient to consult a doctor until such symptoms are well marked and until it is often too late for a successful removal of the growth. Moreover, in a hidden cavity like the pharynx where there is room for the growth to expand unseen, the first symptoms are trivial and may be neglected until secondary growths are manifest in the cervical glands.

The intrinsic cancers of the larynx are seen at an earlier stage as the early symptom of hoarseness sends the patient to the doctor much sooner, but cancer seen in its earliest stage is more difficult to diagnose accurately. Hence cases of intrinsic laryngeal cancer present more frequent and more difficult problems in accurate diagnosis. I propose therefore to spend most of the time available in discussing the diagnosis of intrinsic cancer of the larynx. It is to be hoped that the more frequent use of the modern direct oscope and direct laryngoscope, and suitable cancer propaganda, will produce the much needed earlier diagnosis of extrinsic cancer. The earlier stages of these cases may then present as many problems in diagnosis as the intrinsic cases.

Extrinsic Cancer

The characteristic and offensive epithelomatous ulcer commencing just below the arytenoepiglottidean fold and rapidly involving that side of the larynx, produces fixation of the vocal cord with its consequent hoarseness. The first symptoms are sore throat and pain radiating to the ear with a definitely tender spot near the greater cornu of the thyroid cartilage, then follows the characteristic hoarseness or roughness of the voice, with a copious frothy blood stained expectoration. The top edge of the growth can be seen with the laryngoscope and palpation with the finger reveals the stony hard ulcer.

A post cricoid carcinoma which commences as a superficial growth on the posterior aspect of the cricoid cartilage in women soon surrounds the lumen of the pharynx and spreads upwards to form the whitish warty upper edge seen in the later stages behind the oedematous arytenoids. These patients first complain of a soreness or pricking sensation with pain in the ears during swallowing. Pressure on the cricoid backwards against the spine or lateral movement of the larynx produces pain in practically all cases. Dysphagia occurs early and when these symptoms are present without a satisfactory explanation the patient should be examined with a directoscope or oesophagoscope. The laryngoscopic mirror will not show any signs in the early stage, and when the upper edge of the growth is visible the disease is advanced, and matters are still more hopeless when a vocal cord is paralysed. Neither is the growth within reach of the longest finger, and the passage of a bougie is valueless and even harmful. In the absence of physical signs, the dangerous diagnosis of neurasthenia is still made but such a diagnosis should never be concluded until the presence of a growth has been eliminated by a direct examination.

Carcinoma in the vallecula either on the base of the tongue or on the anterior surface of the epiglottis excavates the base of the tongue and rapidly extends to the surrounding structures and the submaxillary and deep cervical lymphatic glands of both sides are soon involved. The only symptoms are persistent severe pain and a catch on swallowing located by the patient to the base of the tongue with blood-stained salivary expectoration. Occasionally a chronic paroxysmal cough is the first symptom. Later the painful and limited protrusion of the tongue with the accompanying trismus impedes laryngoscopic examination but the growth is within easy reach of the palpating finger and does not require a skilled laryngologist or endoscopist to detect and gauge the extent of the growth. The situation, the characteristic appearance, the odour, and the history of these growths make the diagnosis more or less obvious, but the differential diagnosis should always be considered, as I have seen two cases of syphilis in the post-cricoid region which have been mistaken for carcinoma.

Intrinsic Cancer

A rapid and accurate diagnosis of a typical case of intrinsic cancer of the larynx is easily made. The characteristic miniature epithelomatous wart or ulcer situated on the middle or anterior third of the vocal cord in a patient of cancer age, in which the differential diagnosis of chronic laryngitis with pachydermia, tuberculosis, syphilis, and a simple tumour can be undoubtedly excluded, presents no difficulty. Such a growth has been and is frequently removed by operation without a pre-operative diagnostic section. On the other hand the atypical case or the hidden subglottic growth requires considerable ingenuity in diagnosis. The differential diagnosis may be obscure, and tuberculosis is more often mistaken for cancer than any other condition. A chronic tuberculous ulcer of the vocal cord in a man of cancer age or a healed scarred tuberculous lesion which has broken down with a recrudescence of the disease closely resembles cancer.

Lupus, owing to its distribution in the soft tissues, is more readily distinguished, but in both cases tubercle bacilli cannot always be found in the sputum. In a few cases of tuberculosis it is almost impossible to make an accurate diagnosis without microscopy. The guinea pig test by inoculation from the piece removed unfortunately takes six weeks to mature, but it is so conclusive that it might be useful. Chronic laryngitis with localized pachydermia renders diagnosis difficult, but the long history, the type of patient, the slow progress with a tendency to a wide distribution gives the clue.

Syphilis is readily differentiated from cancer. The presence of other syphilitic lesions, the history, and the Wassermann reaction indicate the correct diagnosis, but when cancer is grafted on an old syphilitic lesion the diagnosis may be difficult and can only be settled by the aid of the microscope.

Benign or simple tumours are recognized by their appearance, their situation, and slow growth. These tumours are usually removed by intra-laryngeal methods, and if the section for microscopy in any way suggests malignancy a more extensive operation can be done. Occasionally a malignant tumour has been labelled by the section to be benign or a papilloma has recurred and has become locally malignant.

Sarcoma of the larynx is fortunately very rare. I have only seen two cases, both in young adults. The tumours were smooth, sessile globular, and vascular, and occupied

* Read in opening a discussion in the Section of Laryngology and Otology at the Annual Meeting of the British Medical Association, Winnipeg, 1930.

the inner surface of the aryteno-epiglottidean fold and ventricular band The tumours bulged into the pyriform fossa of the pharynx and rapidly increased in size Chevalier Jackson states that *not one true sarcoma was found among* 643 *neoplasms* of the larynx seen at his clinic, and there are only three specimens of sarcoma of the larynx to be found in all the museums of the London medical schools The diagnosis of sarcoma is completed by exploration and a diagnostic section, and a survey of the literature of such cases shows the tumours to be either round celled or spindle-celled sarcomata

The subglottic growth, often found below the anterior third of the vocal cord, cannot be clearly seen by the direct or indirect method of examination A heaviness in movement or fixation of the vocal cord occurs comparatively early in subglottic growths, but our President, Sir St Clair Thomson, has shown that it is undoubtedly a late and unfavourable sign in the manifest cancer The diagnosis of such cases of cancer should be made before fixation of a vocal cord is evident The subglottic growth is more malignant and is quickly disseminated to the cervical lymphatic glands—therefore an early diagnosis is urgent and the "wait and see" policy cannot be adopted

The directoscope and Jackson's anterior commissure laryngoscope with retraction of the vocal cord outwards now enable us to obtain a better view of the subglottic growth and the subglottic extension of a more manifest growth

There is still some controversy as to the value of the removal of a portion of the growth for diagnostic purposes Our President in July, 1922, recorded that in 37 out of 51 of his cases, the diagnosis was completed and proved to be accurate without the removal of a piece for diagnosis In the remaining 14 cases the diagnosis obtained by a diagnostic section was misleading in two cases A diagnostic section is a valuable but not an infallible aid to diagnosis, and it *should be emphasized that a negative section should be* ignored and considered to be useless The value of a diagnostic section is increased if a sufficiently large and deep portion from the centre of the growth is removed The whole portion should be carefully sectioned and searched from the surface to the depths and a number of sections made For mechanical and other reasons, it is frequently difficult to obtain a satisfactory or sufficiently deep piece for section, but we are now better equipped with Jackson's tissue forceps and improved direct laryngoscope There is an impression that the direct method of examination should be more frequently employed and every opportunity should be taken to make use of it For example, when an anaesthetic is given for the extraction of teeth as a preparation for operation, information can be obtained by a direct examination

If the diagnosis is in any way doubtful, a diagnostic section is imperative and hastens the diagnosis If the wound produced by the removal of a portion does not heal, or if the tumour increases in size, it is strong evidence in favour of cancer I have never seen any harm arise after the removal of a diagnostic piece, but the picture may be entirely altered and diagnosis made more uncertain in the case of a negative section No doubt in suitable cases time will settle the diagnosis, and judicious waiting, with an examination once a week or at even longer intervals, will finally reveal the accurate diagnosis, but patients and their friends are apt to become restive and demand to know whether it is cancer or not It is not always expedient to delay by waiting, but there are cases in which it is advantageous to wait and to be cautious The delay, which should be as short as possible, gives an opportunity to have the teeth and mouth cleaned up It serves to get the patient in training for an operation and a second opinion can be obtained if desired It is often useful and expedient to have a second opinion, it increases the patient's confidence in his surgeon and may be helpful

If these methods of diagnosis fail in a case of suspected cancer it is justifiable to perform an exploratory laryngofissure with full permission to proceed to a radical operation Where the growth is obscured by oedema of the mucosa or by inflammatory changes, such an exploratory operation is a necessity It has been done, and no harm to the patient has accrued, particularly in those cases in which tuberculosis has been excluded Exploratory laryngofissure has of course been frequently done to ascertain the extent of the growth and to decide whether a partial or complete laryngectomy is necessary

Conclusions

1 An earlier diagnosis of extrinsic cancer of the larynx is urgently needed

2 Time will settle the diagnosis in some cases of intrinsic cancer, and it gives an opportunity to prepare the patient for operation, etc

3 The direct method of examination is an aid to diagnosis and will ascertain the extent of the growth

4 A diagnostic section of an intrinsic cancer is a valuable but not infallible aid to diagnosis Such a section should be made in all doubtful cases

5 An exploratory laryngofissure is justifiable when all other methods have failed

Memoranda:

MEDICAL, SURGICAL, OBSTETRICAL.

AN UNUSUAL CASE OF INTESTINAL OBSTRUCTION

THE following case we believe to be unusual as we cannot find reference to similar cases in the literature at our disposal

T K, aged 27, a reservist ambulance orderly, was admitted to hospital at 10.30 a.m. on January 16th, 1930 He gave the history that the previous evening at about 7 p.m. he had partaken of a heavy meal, almost immediately afterwards being seized with acute abdominal pain He vomited at the time and continued to do so throughout the night The following morning he reported sick at his medical inspection room and was at once sent to hospital for admission

On arrival the patient was markedly collapsed, with a pinched face and a pulse uncountable and imperceptible at the wrist The respiration rate was 22 and the temperature 97.7° F. The abdomen was distended, rigid, and tender, especially in the epigastrium, movements were practically nil The patient had not passed urine and the bowels had not been open since before the onset of the attack, a gentle enema gave no result He was at once given brandy 1/2 oz. and pituitrin 1/2 c.cm., and prepared for operation

The abdomen was opened by a mid line subumbilical incision. Loops of slightly distended but much engorged small gut presented, and the abdominal cavity contained a considerable amount of blood stained fluid. The trouble was eventually traced to the sigmoid loop, which was long and mobile, and which had swung across the abdomen to the right side, where it had herniated into a large retrocaecal fossa It was tightly gripped in this position by a tense peritoneal band extending from the abdominal wall behind the caecum to the lower end of the attachment of the mesentery of the ileum The sigmoid loop was tightly stretched but was not twisted It was found that in taking up this position it had come to lie across the mesentery, obstructing the blood supply of the ileum for six or eight feet to within one foot of the ileo-caecal junction, where the structures, including the appendix, were quite normal

The constricting band of mesentery was divided and nine inches of strangulated, distended, and engorged sigmoid colon withdrawn, *this might have recovered, but the viability of the* small gut was very doubtful The ileum above the obstruction was turgid but not greatly distended, the portion involved was blown out, but the bowel from below the obstruction round to the sigmoid was *nearly empty and normal in every way* Continuous intravenous saline was given throughout the operation but at this stage life was almost extinct and it was considered advisable to close the abdomen The patient died about one hour later

The points of interest in this case seem to be the sudden onset, the absence of any marked distension, and the nature of the double obstruction There were no adhesions to suggest a congenital malposition of the sigmoid A possible explanation is that the small intestine was the first to suffer, allowing the contents of the large bowel to travel on till they reached the sigmoid loop, where they were held up, and so led to the second strangulation

CLINICAL AND SCIENTIFIC PROCEEDINGS

NORTH LANCASHIRE AND SOUTH WESTMORLAND BRANCH

Puerperal Sepsis

In a presidential address to the North Lancashire and South Westmorland Branch of the Association, Dr COLIN M CRAIG put forward some arguments against the exogenous theory of puerperal infection

Dealing first with the introduction of sepsis, Dr Craig said that until recently puerperal sepsis was ascribed to mismanagement of the case by the practitioner or nurse, and the theory of endogenous infection received scant credence Mr Victor Bonney had no support when he gave it as his opinion, some years ago, that many cases of sepsis had an endogenous origin A statement which illustrated the orthodox view had been made by Dr Robertson medical officer of health for Edinburgh who included sepsis haemorrhage, and eclampsia as conditions which could justifiably be classed as preventable Dr Craig believed that more investigation would be necessary before it was possible to endorse such a statement Sepsis might be introduced from without or it might arise from a pre-existing focus in the body During the past eleven years he had attended over 600 maternity cases, many of them abnormal He had published in the *Journal* of June 8th, 1929, a series of cases of puerperal sepsis presenting features which called for explanation, but it would be of interest to quote their salient points again

Case 1—A healthy multipara aged 36 was delivered spontaneously without a vaginal examination or other intervention On the fourth day she developed a temperature of 103° F at operation on the fifteenth day pus was found in the left ovary and at the junction of both tubes with the uterus with cellulitis of the *left broad ligament A subtotal hysterectomy with drainage was* performed and the patient made a good recovery Examination of the pus showed the infecting organism to be a streptococcus and subsequent cultures from the teeth gave a growth of three types of *Streptococcus longus*

In considering this case, said Dr Craig a series of experiments on dental sepsis carried out by Dr Rosenow at the Mayo Clinic was suggestive and relevant Rosenow infected the pulp cavities of healthy dogs with streptococci obtained from cases of ulcerative colitis and *renal lithiasis A large percentage of the animals* developed colitis and lithiasis, showing the possibility of systemic invasion from infected teeth In a case of multiple cerebral abscesses recently examined after death by Dr Craig the septic condition of the teeth constituted the obvious source of infection

Case 2—Repeated haemorrhage in a case of placenta praevia in an elderly primipara led to the performance of Caesarean section The preceding vaginal examination was made at a nursing home under strict surgical precautions but the patient ran a temperature for five weeks, and developed a pyaemic abscess in the thigh This indicated that an infected clot had been disturbed in separating the placenta, and again the teeth were probably responsible

Case 3—A multipara spontaneously delivered in a nursing home without any intervention had had a cold on admission, and on the third day a rigor she died after developing multiple pyaemic abscesses

Case 4—A multipara was spontaneously delivered before the arrival of the doctor or nurse there were no lacerations She recovered after a long period of pyrexia.

Case 5—The child was born before the arrival of the doctor who was met by an hysterical patient at the door carrying the baby in her arms with the placenta attached Subsequently she ran a high temperature and examination revealed a mass of thrombosed veins in the base of the *left broad ligament* There were no lacerations of the cervix and nothing abnormal in the uterus septic teeth and tonsils were both present The patient recovered after a prolonged period of pyrexia.

Case 6—A forceps delivery in a farmhouse there were no lacerations and nothing was retained The patient developed a temperature on the third day and her urine on culture showed a heavy infection with *B coli*. She made a good recovery

Case 7—Another case in which the baby was born before the arrival of the doctor and no examination was made On the third day she became pyrexial and the urine was found to be heavily loaded with *B coli*

Case 8—A typical case of infection probably introduced per vaginam An elderly primipara with a generally contracted pelvis was delivered after much manual intervention of a stillborn child which had presented by the breech She had slight pyrexia for several weeks and several small abscesses developed but eventually she made a good recovery This case illustrated the mild type of infection which more frequently seemed to result from vaginal interventions

These cases of puerperal pyrexia, with the exception of the last, said Dr Craig, indicated *infection from within* Among 200 operations for appendicitis he had had three cases complicated by a virulent haematogenous infection of the kidney with *B coli* These were cases of blood infection arising from a form of local sepsis, the percentage agreed with the percentage incidence of his cases of puerperal sepsis, suggesting that these also had a haematogenous origin The commonest organism in severe puerperal sepsis was *Streptococcus pyogenes*, but in the milder cases pure infections of *B coli*, diphtheroid bacilli, non-haemolytic streptococci, and various Gram negative organisms were found Among 134 febrile cases investigated at Queen Charlotte's Hospital not all those infected with *Streptococcus pyogenes were severe* in type, *eight were mild* Dr James Young of Edinburgh had recently stated that where hospital *environment* was kept *free from puerperal* infection by the elimination of emergency or mismanaged cases, such factors as throat infection were relatively insignificant, but this did not solve the problem of Dr Craig's cases quoted above In the investigations carried out by the Public Health Department of Aberdeen during the ten years from 1917 to 1927 the haemolytic streptococcus was established as the infecting organism in puerperal sepsis The throat was the normal habitat of this organism, and the suggestion was put forward that hands and instruments were infected by droplets of saliva from the mouths of carriers But though suggestive evidence was forthcoming, the theory in Dr Craig's view, *was not yet proved*

A comparison of the cases attended by doctors and midwives showed a mortality rate of *6 9 per 1,000 for doctors* and only 2 8 per 1,000 for midwives But there could be no comparison between the types of cases attended by doctors and midwives, and in point of fact the lowest mortality rate occurred among cases attended jointly by doctors and nurses In the Aberdeen report the total death rate recorded over the ten years period was 6 6 per 1,000, while in institutions the figure reached 14 9 per 1,000 The general rate of sepsis was 1 5 per 1 000, but in institutions it rose to 4 5 per 1 000, the district rate was 0 7 per 1,000 Apparently the home was still the safest place for confinements A certain proportion of cases of puerperal sepsis must result from mismanagement and the introduction of infection from without but Dr Craig's experience had been that many cases delivered under bad *surgical conditions did not become septic Moreover, though* the medical man of to-day was more surgically clean in the conduct of his cases than his predecessor of forty years ago, no apparent reduction had taken place in the incidence of puerperal sepsis

Dr Craig concluded that the mild type of sepsis *due to B coli* and other organisms, was probably introduced per vaginam, but in some cases developed as a *blood* infection through neglected bowel conditions The severe type due to *Streptococcus pyogenes* resulted from a *blood* infection arising from septic conditions of the mouth and throat more often than it did from exogenous infections In institutions when outbreaks took on an epidemic character infection was probably conveyed from patient to patient by the hands of the *attendants*. The best chance of bringing about a reduction in the mortality rate lay he believed in adequate ante-natal care the elimination of septic teeth, septic tonsils and constipation the provision of accommodation in hospital for difficult or abnormal cases, and the securing of a capable nurse and doctor for the normal cases, who would then take no harm even under bad home conditions

Reviews.

AN INTRODUCTION TO TROPICAL MEDICINE

IN their recent book[1] SIR LEONARD ROGERS and Major-General MEGAW, who have had long experience of tropical medicine, particularly in India, depart from the plan usually adopted by writers on this subject Instead of devoting large sections of their book to medical zoology and parasitology, they deal with these in outline and mainly from the point of view of diagnosis and prevention The result is that the accounts of the diseases themselves are not obscured by lengthy descriptions of the parasites or their vectors—matters which may be of interest to a minority of tropical practitioners, but which may appear redundant to others whose chief duty it is to diagnose disease and treat the sick Nevertheless, enough is included to render the etiology of the diseases intelligible to every ordinary reader, who, if he wishes, may obtain more detailed information from the larger books on tropical medicine or on the various branches of medical zoology

The book is divided into eleven sections The first three deal with febrile diseases caused by protozoa, spirochaetes, and unknown viruses Sections IV and V describe the typhus fever group and bacterial febrile diseases There follow sections on bowel diseases with symptoms of dysentery and diarrhoea, diseases with the most prominent symptoms on the surface of the body, helminthic diseases, diseases caused by venomous animals, diseases associated with diet, and diseases caused by heat and light The classification which this arrangement entails is in the main a purely clinical one, and leads to the separation of amoebic hepatitis from amoebic dysentery and oriental sore from kala-azar, though the parasites involved are either identical or very closely related Each author has been responsible for about half of the book, the author's name appearing at the end of the part he has written Thus the first author writes on kala-azar, plague, amoebic dysentery, leprosy, cholera, helminthic diseases, and the second on malaria, relapsing fever, yellow fever, typhus fever, diet, climate The descriptions are clear and concise, and give all the essentials of clinical manifestations, diagnosis, and treatment There are seventy-seven illustrations and two coloured plates The illustrations consist of maps, temperature and other charts, photographs of cases, and a series of diagrams which show at a glance the etiology of those diseases in which intermediate or secondary hosts are concerned The two coloured plates represent blood cells, blood parasites, bacteria, intestinal protozoa, and the eggs of helminths

As the authors state in their preface, the book makes no pretence at being complete Their object has been to produce a handy book which will give a broad survey of the field and serve as an introduction to the subject of tropical medicine There is no doubt that they have accomplished what they set out to do, and students of tropical medicine will be grateful to the authors for having given them a simple straightforward account of tropical diseases, free from the encumbrance of a mass of detail which is clinically unnecessary Moreover, compared with other textbooks the price is low, so that there is little doubt that it will be very widely read The reputation of the authors is a sufficient guarantee of the quality of the book They write almost entirely of what they have seen themselves, and when discussing treatment recommend what they themselves have found to be most beneficial As an introduction to the subject of tropical medicine a student could do no better than to read this book carefully and make himself thoroughly familiar with its contents before seeking for more detailed information in a wider field

Megaw, C.I.E., V.H.S., M.B., B.Ch., B.A.O., Major General Indian Medical Service Churchill's Empire Series London: J. and A. Churchill 1930 (Roy. 8vo, pp. x + 536, 77 figures, 2 plates, 16s.)

GYNAECOLOGY AND OBSTETRICS

THE volume on *Diseases of Women by Ten Teachers*[2] has made such a definite place for itself in British gynaecological literature that it is no surprise to see it come out in a fourth edition Mr. Comyns Berkeley has apparently been mainly responsible for the editorship of this edition, and two of the original ten authors have resigned their places to younger men The anatomical and physiological sections have been largely rewritten, and in all other respects the book has been as far as possible kept up to date Beyond this nothing need be said, because the book is already so well known, alike to teachers, students, and practitioners, that to praise it is superfluous

Professor HENRY JELLETT'S *Short Practice of Midwifery*[3] has now reached its tenth edition (fortieth thousand), which is a record that may well gratify its author The present edition has been carefully revised with the assistance of Drs. Pearson, Milligan, and Averill, of the Christchurch Hospital, and Dr. Lewis of the Hornby Mental Hospital, New Zealand Several new illustrations have been added, and Dr. Hastings Tweedie and Professor Strogonoff have contributed accounts of the methods of treatment of eclampsia associated with the Dublin school and with Professor Strogonoff's name respectively The author attributes much of the success of the book to the fact that in practical matters it has given the teaching of the Rotunda Hospital, and that this teaching has always been conservative We believe, however, that in, for example, the treatment of accidental haemorrhage, the present practice of the Rotunda Hospital does not lay such stress, as this volume does, upon packing the vagina It is also surprising to find six pages in this "short" textbook devoted to the practically extinct operation of pubiotomy, while only a page and a half is devoted to the lower segment Caesarean section While wholly in accord with Professor Jellett's objection to the unnecessary resort to Caesarean section, and while recognizing that the brevity of his description may have propagandist significance, yet we seem to detect here a lack of proportion The appendix, as in previous editions, contains an interesting table embodying statistics of the Rotunda Hospital up to the year 1927 We are confident that this is far from being the last edition of a most useful textbook

Dr. J. S. FAIRBAIRN'S *Textbook for Midwives*[4] has reached its fifth edition, which is a satisfactory indication of its popularity among those for whom it is written A general revision and some rearrangement of matter characterize this latest edition The discussion of the physiology of reproduction has been improved by the introduction of some new figures, as well as by the addition of some further text The requirements of midwife-teachers have been kept in mind, as well as those of the pupil midwives, and it is quite safe to prophesy that for both classes of readers this new edition will maintain the popularity and high reputation of Dr. Fairbairn's work

PUBLIC HEALTH IN FRANCE

M. A. LANDRY has written a very readable book on Public Health in France[5] He is not a medical man, but holds a chair at the Sorbonne, and has written several works on political economy At present a Deputé, he has reached ministerial rank in two Cabinets M. Landry was called upon to write an introduction to the budget of the Ministry of Labour and Hygiene for 1930, and has taken

[2] *Diseases of Women by Ten Teachers* Edited by Comyns Berkeley, H. Russell Andrews, and J. S. Fairbairn Fourth edition London: Arnold and Co. 1930 (Med. 8vo, pp. xi + 558, 186 figures, 8 plates, 18s. net.)

[3] *Short Practice of Midwifery* By Henry Jellett, M.D. Dublin University, F.R.C.P.I. Tenth edition London: J. and A. Churchill 1930 (5½ × 8½, pp. xv + 662, 282 figures, 4 plates, 18s.)

[4] *Textbook for Midwives* By John S. Fairbairn, B.M., B.Ch. Oxon., F.R.C.P.Lond., F.R.C.S.Eng., etc. Fifth edition Oxford Medical Publications London: Milford, Oxford University Press 1930 (Roy. 8vo, pp. xiii + 369, 119 figures, 3 plates, 25s. net.)

[5] *L'Hygiène Publique en France* Par A. Landry, Député, Ancien Ministre Paris: F. Alcan 1930 (4½ × 7½, pp. 173, 15 fr.)

the trouble to arrange that the general public in France shall have the benefit of it The language is clear and the matter excellent He writes as a politician but so well informed a politician is he that the medical reader is always wondering how a politician can write so much like a public health worker The clarity of his mind is such that after writing a page attempting to define the difference between public health and social hygiene he virtually gives up the attempt Again, he cannot pass the word 'preventorium," a term used in France for an institution where surgical tuberculosis is treated without commenting on the inappropriateness of the word He considers 'pre tuberculous' a senseless term, in fact predisposition to tuberculosis is a myth, it is not a scientific reality' Broad views are put before the reader Comparisons with foreign countries are made to point a moral the French people are told that in 1927 in France there were 45 deaths from typhoid fever per million of the population against 20 only in Switzerland and 9 in England Home truths about venereal disease are conveyed in the polite form of figures syphilis kills 80 000 French people every year, it causes every year 40 000 abortions and the death of 20 000 unborn children, and beyond that thousands of those born are degenerate mentally afflicted, deaf mutes or afflicted with diverse infirmities gonorrhœa is the distant cause of the urinary disorders which carry off men between the ages of 50 and 60 Although some charlatans who pretend to treat venereal disease have been driven out of business, others manage to get a living M Landry shows us that the French nation are alive to the evil, railway companies even have their own venereal disease dispensaries, the foreign workmen brought in to do manual work attend special dispensaries, in some cases set aside entirely for their use The work which remains to be done is set out in a long chapter M Landry's general conclusion is that the state of the public health in France cannot be described as anything but mediocre, and that the French people must be prepared to make sacrifices and spend more money on pulling it up The author has proved himself a patriot he has told his country important, if not pleasing, truths Although perhaps we cannot learn from this work new sanitary measures which might usefully be imported into Britain it provides an object lesson in how such books should be written

KREHL'S PATHOLOGICAL PHYSIOLOGY

PROFESSOR KREHL has just published the first volume of the thirteenth edition of what we are accustomed to speak of as his *Pathological Physiology* His title for the whole work is "The Etiology, Diagnosis, and Treatment of Internal Diseases'; the present volume being devoted to etiology, under which term are included pathogenesis and pathological physiology He expresses the hope, in which the numerous admirers of his work will join, that his strength may hold out to complete the final volume on the fundamentals of diagnosis and treatment

It might seem superfluous to do more than mention the fact that so well known a book had reached its thirteenth edition, retaining its original features, with the addition of discussions on the more recent developments of the science To many English readers, however, the book is known through Dr Hewlett's translation, which was made many years ago and is to some extent an abridgement of the fourth edition, it is therefore necessary to refer to the present edition to obtain a correct idea of the aim of the author and the scope of the work Professor Krehl appears to take his stand on two fundamental principles. In the first place while recognizing the importance of empiricism, he writes from the standpoint of physiology expounding pathological processes as far as possible in physiological terms He has, of necessity, to indicate innumerable gaps which remain for science to fill in but there can be but little doubt that this manner of viewing pathological processes is for the practitioner more useful in the long run than the common practice of seeking to give disease names to groups of clinical symptoms and signs It keeps in view what is actually going on in the body In the second place, Professor Krehl observes that a knowledge of the *normal* physiology of man does not at present exist Isolated facts have been discovered from time to time from the study of man, but in reality human physiology is founded on observations made on animals He bears witness to the extreme value of these observations but to the extent that deductions from them have been applied to human physiology the latter remains a theoretical science. It was, he considers, a great advance in the development of pathological physiology when largely under the influence of Naunyn's teaching, clinical observation took its place beside the old form of experimental physiology in the investigation of pathological processes In adopting the principle of explaining the pathological through the physiological Professor Krehl therefore insists that these terms refer, not to animal, but to human pathology and physiology and that these can be learnt only from patients themselves and in the clinical laboratory and he restricts himself to the exposition of pathological processes as he conceives them to occur in the human subject and as deduced from clinical research.

On the masterly way in which the vast material is handled there is no need to comment one feature of particular value to those who are precluded from making any extensive study of the literature may be mentioned Professor Krehl brings his judgement and experience freely to bear on the numerous questions at issue in the problems engaging the attention of pathologists at the present time, and gives clear indication where caution and reserve are desirable in accepting deductions put forward

EXERCISE IN CONVALESCENCE

THERE can be no question as to the value of Lieut.-Colonel JAMES K. MCCONNEL'S little book on *Shorter Convalescence*, seeing that its merits are vouched for in a foreword by Sir ROBERT JONES who says that it "deserves a wide circulation and cannot fail to be useful to the student, the doctor and the nurse' It remains for us therefore only to draw attention to the matter contained in the various sections of the work There are eight of these and an appendix on convalescence after confinement The titles of the sections are "Introductory' "Developmental survey' Physiological considerations" "Types of bed exercises,' "The effect on the circulation" Posture and respiration" 'Unilateral action of the abdominal wall," and "The moral effect of minor exercises' There can we think be no doubt that convalescence after illness or operation may be much helped by gentle volitional exercises such as are here described and that the gradual training in the living position, of weakened muscles may prevent their yielding to the unaccustomed strain which the first resumption of the erect position is bound to throw upon them This is true of the muscles in general In particular, as the author points out, the muscles of the lower extremities are apt to suffer from prolonged disuse, which may be remedied by gentle voluntary movements while the patient is still confined to bed

NOTES ON BOOKS

IT is only three years since the first edition of *Minor Surgery*[1] by Dr ARTHUR E. HEWITT and Dr VICTOR E. CHEEKE was published and already a second edition has been called for A few alterations have been made in the text and thirty seven illustrations have been added The authors confine themselves to describing the methods and the technique which they have found most useful in their own clinic The pathology of disease has not been discussed since the object of the book is wholly to aid the student to understand what he sees in his daily work and to enable him to give a general perspective of the subject which may be only partly illuminated by his clinical

[1] *Shorter Convalescence*. By Lieut.-Colonel JAMES K. MCCONNEL D.S.O., M.C., with a foreword by Sir ROBERT JONES, K.B.E., C.B., F.R.C.S. London: W. Heinemann (Medical Books), Ltd. 1930. (Cr. 8vo, pp. xii + 132, 10 figures. 5s. net.)

[2] *Minor Surgery*. By Arthur E. Hewitt, M.D. and Victor E. Cheeke, M.D. Second edition. London: H. Kimpton. 1930. (8½ × 5½, pp. 602, 62 figures. 21s. net.)

[1] *Entstehung, Erkennung und Behandlung innerer Krankheiten*. Von Dr. Ludolf Krehl. Erster Band, *Die Entstehung der inneren Krankheiten. Lehre von der Pathologischen Physiologie*. 13 Auflage. Lieferung I. Leipzig: F. C. W. Vogel. 1930. (Supervision Fee, part VI.)

observations In spite of the otherwise very complete survey of the subject, no mention is made of even the simplest of fractures or dislocations The book is freely illustrated with photographs and diagrams the photographs are not uniformly successful, but the drawings are beautifully clear

Professor HERMANN SCHLESINGER'S concise, practical, and readable little book on the clinical aspects and treatment of diseases in old age[9] is a reproduction, with considerable additions, of articles lately published in the *Deutsche medizinische Wochenschrift* The diseases discussed include those which are more or less confined to old age, such as senile osteoporosis, prostatic hypertrophy, senile bronchial catarrh, and atheroma, and also affections met with at other stages of life, but presenting deviations from the ordinary clinical type when they occur in old age, such as tuberculosis, acute infectious diseases, and various systemic disorders The concluding pages are devoted to the diet and hygiene of old age

In a volume entitled *The Structure and Meaning of Psychoanalysis*[10] DRS WILLIAM HEALY and AUGUSTA F BRONNER, together with Miss ANNA MAE BOWERS, have aimed to give an organized statement of what has been contributed to date in psychoanalysis in the spheres of psychology and psychiatry An original method of presentation has been adopted On the left hand pages are what may be called the orthodox theories and fact findings of psychoanalysis On the right-hand pages are introduced contributions of exegetical value, some notable accessions to the psychoanalytic structure by "Freudians", and various ideas set forth by those who, still holding to the major concepts of Freud, offer divergencies of theory or practice

The Effects of Moisture on Chemical and Physical Changes,[11] by J W SMITH, is an important contribution to the systematic study of the influence of water vapour on chemical and physical reactions classifying and correlating numerous references to the subject in scientific literature Another compendious volume in the same series is Mr AUDEN'S *Sulphuric Acid and its Manufacture*,[12] which expounds the fundamental problems associated with the manufacture of sulphuric acid and gives some account of methods of procedure and types of manufacturing plant The text is accompanied by references to the original articles A third textbook of physical chemistry, *Photo Processes in Gaseous and Liquid Systems*,[13] by R O GRIFFITH and A MCKEOWN, surveys the results of recent investigations chiefly in regard to the theoretical aspects of photochemistry

A Medical Medley[14] is a collection of parodies, verses, and caricatures, such as form the brighter part of hospital magazines, written by the students of the University of Birmingham, and are therefore mainly of local interest But the verses are clever, and some of the well known teachers of the school are represented as they appear to their critical audiences, thus a surgeon is made to exclaim, after Gilbert's major general in the *Pirates of Penzance*

"Why all the staff and nurses at the General think a lot o' me.
My technique's irreproachable in doing a gastrotomy

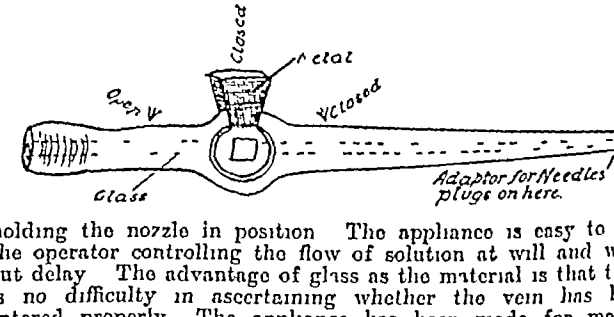
PREPARATIONS AND APPLIANCES

THE IMPLANTATION OF RADON SEEDS

Mr E WATSON WILLIAMS, Ch M, F R C S (Clifton), writes The valuable article by Mr Souttar in the *Journal* of August 23rd (p 273) is of particular interest in that it draws attention to the utility and efficacy of radium treatment by means of radon seeds In many regions the employment of radium needles has established itself as a therapeutic measure, but in others radium needles are difficult to insert and still more difficult to retain, while the threads which their use necessitates are a source of considerable inconvenience to the patient Of no region is this more true than that of the pharynx and gullet, where radon seed treatment presents enormous advantages in technique, provided the results are comparable

I have had an instrument made to facilitate the implantation of seeds by peroral endoscopy, and an account of it may be of interest in this connexion It is modelled on the ovipositor of insects The "business end" consists of a collar threaded internally to screw on to the shaft of an oesophageal forceps, such as are made with universal handles and interchangeable heads. Distal to the collar is a portion 2.5 cm long, and threaded externally to take the guard, from the end of this portion the instrument is continued forward in the form of a fine hollow steel needle, coming to a sharp point. The needle is formed of two apposed springs, on one side near the base a window is cut to admit a radon seed The seed is just "held" when pushed forward by the plunger, so that



Shows plunger opening spring point and planting radon seed seed half extruded The vertical scale has been exaggerated for the sake of clearness

it does not move during introduction The plunger runs the whole length of the instrument, and is reduced to 1 mm diameter for its distal 5 cm—that is to a small fraction less than the usual diameter of a seed, the length of the plunger is such that it projects 2 mm beyond the point when pressed right home The guard consists of a flat C shaped piece, 6 mm across, and attached by two legs to a collar which screws on to the external thread just described, the distance beyond the end that the point can project being regulated by screwing the guard up or down The reason for the C shape, rather than a circle, is to enable the points to be kept in view when working down a long tube, for the same reason the milled collars are bevelled flat along their "upper" surfaces—that is, the ventral surface when working on a supine patient The placing of seeds at any depth from the surface can be accurately and rapidly performed

The instrument was made for me by Messrs Allen and Hanburys, Ltd, and in my case to fit Mr Crow's handle, but there is nothing to prevent the thread being made to fit any suitable pattern of oesophageal forceps

GLASS INTRAVENOUS NOZZLE

Dr J BYRNE (West African Medical Staff) writes The nozzle illustrated in the diagram is specially useful in intravenous work—for example, administering salines It is all glass except the metal lever for moving the stopcock The latter can be opened or closed by the forefinger of the hand

holding the nozzle in position The appliance is easy to use, the operator controlling the flow of solution at will and without delay The advantage of glass as the material is that there is no difficulty in ascertaining whether the vein has been entered properly The appliance has been made for me by Messrs James L Hatrick and Co, Ltd (72, St John Street, Clerkenwell Road, E C 1)

BINOCULARS FOR VIEWING STEREOSCOPIC RADIOGRAPHS

The application of the stereoscopic method to x ray work is facilitated by the introduction by Philips Lamps Limited (145, Charing Cross Road, W C 2) of stereo-binoculars for viewing stereoscopic radiographs in the lantern In appearance this accessory resembles a pair of small opera glasses, but by means of two built-in prisms the normal visual axis is so deflected that the two stereo-radiograms are at once seen as a three dimensional image Means of adjustment to secure perfect fusion and to meet individual requirements are provided The device has the further advantage that distances can be immediately adjusted so as to make possible a general view of the whole field or the examination of details at close quarters The instrument is handy and relatively inexpensive

NINETY-EIGHTH ANNUAL MEETING
OF THE

British Medical Association.

Held at Winnipeg, August, 1930

THE SECTIONS

SUMMARY OF PROCEEDINGS

DURING the next few months there will be published in the *British Medical Journal* the opening papers communicated to the Scientific Sections of the Annual Meeting at Winnipeg The summaries of discussions in this and successive issues are intended to give members who were not present a general idea of the proceedings

SECTION OF MEDICINE

Wednesday, August 27th

FILTERABLE VIRUSES AND PRACTICAL MEDICINE

The President, Lord DAWSON OF PENN, opened the proceedings by expressing his appreciation of the very warm welcome accorded by the medical profession and the citizens of Winnipeg He then contributed a clinical introduction of the subject of filterable viruses, paying tribute to the past and present workers in this field, many of whom were martyrs to science Lord Dawson was followed by Dr S P BEDSON (London), who in an excellent paper stressed the necessity of there being close association between the clinical and laboratory aspects in approaching the solution of the vast problems still to be elucidated The nature of the filterable viruses was first considered, and also the topics of active and passive immunization in virus disease with the various immunity reactions Much of practical value to the clinician had already been discovered and this was reviewed by Dr Bedson, but he pointed out that an enormous amount remained to be done With however the rapidly increasing number of workers in this field a determined effort was being made to obtain a clearer understanding of the virus diseases Dr NEIL MCKINNON (Toronto) referred to the use of convalescent serum in Winnipeg in 1928 in poliomyelitis as an example of a successful fight against a virus infection Similarly the use of convalescent serum in measles would help to reduce the death rate in this disease In Canada, from 1921 to 1929 there had been 5 000 deaths from this so-called harmless malady He suggested that with the resultant light reaction In a paper prepared by Professor NABARRO, read in his absence by Dr John Parkinson, the use of convalescent serum in measles was described The serum was obtained from adults, and remarkable results had been obtained in preventing the onset of this disease in contact cases He was followed by Professor ARTHUR ELLIS (London), who stressed the various ways along which this subject could be approached The conception of disease must, he said be altered There was evidence to show that there was a high percentage of virus carriers in whom disease occurred, not on account of infection from without, but owing to physical or physiological changes which took place in the organism permitting the virus to multiply and overcome the lowered resistance of the individual He gave examples from the plant and animal world, and explained the encephalomyelitis complicating vaccination on this basis The PRESIDENT, following up Professor Ellis's theory described in detail the history of an interesting case of herpes zoster which appeared to justify the assumption that the infection came from within Dr BEDSON then spoke briefly in reply

THE TREATMENT OF HYPERTENSION

Professor J C MEAKINS (Montreal) in a paper on hypertension, outlined the history of the treatment of this disease, and insisted on the necessity of control This was achieved in his cases by allowing a period of three or four weeks rest in bed before beginning the observations Blood pressure readings were carefully taken four times daily, and the average for the day was used in his record He described his results with ergotamine which when administered orally, had had little effect when injected intramuscularly in 1 to 5 mg doses, it produced a prolonged but temporary effect upon the blood pressure and caused slowing of the pulse The blood pressure was lowered thirty to sixty points (diastolic and systolic) for a period of one hour A similar but much more prolonged result was obtained by using acetocholine in 0 1 to 0 2 mg doses freshly prepared in 10 per cent glucose solution Again 72 per cent of the cases of essential hypertension showed a profound drop in the blood pressure and a slowing of the pulse Professor Meakins had noticed no serious ill effects from the use of these substances and recommended them for further serious trial by his colleagues

SECTIONS OF SURGERY AND TUBERCULOSIS.

Wednesday August 27th

RECENT ADVANCES IN THORACIC SURGERY

Lord MOYNIHAN (President of the Section of Surgery) took the chair at the joint meeting of the Section of Surgery with the Section of Tuberculosis The proceedings were opened by Professor E W ARCHIBALD (Montreal), who read a paper on the scope of thoracic surgery He pointed out that much advance had been made since the days of Simpson, and the assurance of safety through the work of Lord Lister and that there had emerged two main points (1) *specialization*, of which the youngest branch was thoracic surgery, which could now occupy the whole time of a specially qualified surgeon, and (2) *team work*—the association of surgeons, physicians radiologists and pathologists—the end-result being the emergence of a man who could devote himself to the surgery of the chest in empyema, bronchiectasis, pulmonary tuberculosis and lung abscess Professor Archibald discussed the advantages and disadvantages of closed drainage in empyema In pulmonary tuberculosis he had seen gratifying results in thoracoplasty, phrenic evulsion and in the combined operation but he had less faith in the operation for dealing with adhesions and with apicolysis As far as selection was concerned he urged attention to the resistance of the patient in connection with fibrosis and scarring and considered that the best type was the good chronic case with contracted chest whereas he had had a 65 per cent incidence of arrest in favourable cases he had had only 38 per cent in conditionally favourable cases and had results in poor cases His work showed that the main cause of death was pulmonary failure by spread of disease in the other lung In lung abscess he had found that in certain cases too much had been attempted for example acute abscesses ought to be left alone On the other hand he had often found that too little was being done for the case of chronic abscess and now by newer methods the mortality of 40 per cent, experienced before 1919 had been reduced to little more than 15 per cent He considered that all cases of bronchiectasis ought to be diagnosed as "simple" or "complicated" before an operation was decided on the congenital abscess with no lung complication was quite distinct from the complicated case with suppuration and lung involvement He had been interested to see recently the good results that could be obtained by the operation of lobectomy and believed that experience would show that a one-stage lobectomy would be an operation much more generally used in unilobar cases

Dr R A YOUNG (London) discussing the medical aspects of thoracic surgery remarked that it was evident now that surgery of the chest could give results comparable with those of abdominal surgery He considered that the medical aspects were wide and that the duties of the physician could be classified under the headings of diagnosis the suitability of the patient the choice of the surgeon the operative procedures the preparation and after-care of the patient and the decision on the time for the application of surgery The diagnosis in basal and mediastinal cases was difficult but nowadays x rays lipiodol and the investigations of bacteriologists and haematologists were of great assistance, as also was

exploratory puncture He considered there was still scope for investigation in respiratory efficiency, but the greatest asset of the physician in many cases was clinical instinct Where artificial pneumothorax was unsuccessful thoracoplasty ought to be considered, he had found it very useful, but he had less faith in the operation for cutting adhesions, and was very doubtful about the value of apicolysis Phrenic evulsion he thought was very good He considered that chronic abscess of the lung ought never to be left untreated, while bronchiectasis had proved so depressing in both medical and surgical practice that he welcomed any further help beyond pneumothorax and thoracoplasty, such as lobectomy, as giving a hope for the future Some of his cases of malignant disease had done well in consequence of operation, he believed there was still further scope The surgeon might be satisfied sometimes, the physician never was, but Dr Young thought the future was very hopeful Mr A TUDOR EDWARDS (London) doubted whether malignant diseases of the lungs had increased during the last ten or twelve years, his belief was that the incidence of cases diagnosed was much higher Unfortunately most cases were very insidious in onset and beyond hope of success when they reached the surgeon As far as type was concerned the order was carcinoma, sarcoma, and endothelioma The carcinomatous type arose in either the bronchi or the parenchyma, and the diagnosis rested on the physical signs, x rays, and bronchoscopy He had found the association of radioscopy with lipiodol very useful, as also had been pneumothorax Thoracoscopy alone was of limited value, although it might help in the diagnosis of tumours of the pleura and sometimes in those of the lung He thought exploration was now safe through intercostal incision In treatment he had found six cases inoperable out of nine where the growth was central, and in these he had applied radium While the method of bomb radium at a distance was of no use in his experience, and the external plaque procedure only helped in relieving pain when the chest wall was involved, his best results to date had followed the insertion of radium seeds by the bronchoscope and open operation Deep x-ray therapy had been very disappointing, but he was satisfied that some effort was being made towards efficiently dealing with the condition

Dr W L MANN (Winnipeg) discussed phrenicotomy, and stated that much advance had been made since paralysis of the diaphragm had been suggested in 1911 It had been found that cutting of the nerve did not produce the desired results, and that even resection had not been sufficient, owing to the many accessory branches of the nerve Avulsion by slow twisting was now the operation of choice, although its application to a smaller length than four inches still gave disappointing results in about 25 per cent of cases The lung volume was lessened by from one-sixth to one-third While the best results were seen in cases of lower lobe disease, good results could be obtained even in apical cavitation The dangers of the operation were not great The main indications were in pulmonary excavation, where thoracoplasty was not possible The operation was of much assistance in residual abscess, and in bronchiectasis with or without pneumothorax, but the best results were achieved in cases of pulmonary tuberculosis where the pneumothorax was incomplete, the case chronic with no pneumothorax possible, and thoracoplasty too serious an operation to face Phrenicotomy had proved valuable in pulmonary haemorrhage, and he believed it should always be performed as a preliminary to thoracoplasty Dr J D MCEACHERN (Winnipeg), who dealt with closed drainage of the chest, described with the aid of a cinema the complete operation Washing out the cavity by Dakin's solution could be performed every two hours without discomfort to the patient, and the continuous negative pressure could be maintained in the meantime In 50 per cent of these cases the patients had been children under the age of 4, and he had had only one death He believed that the operation produced lowered mortality, especially in infants, since no general anaesthetic was necessary, there was less danger of secondary infection, while morbidity was lessened The average duration of treatment was six weeks, this he attributed to the softening influence of the Dakin's solution, to the continued negative pressure, and to the absence of painful dressings

Dr N S SHENSTONE (Toronto) read a paper on pulmonary lobectomy in bronchiectasis, remarking that, while lipiodol had helped in the diagnosis of obscure cases, the etiology and extent of the disease could never be determined until all methods of investigation had been tried He had had seven cases in which one or more lobes had been removed, and had decided on operation in cases where other methods had promised less chance of recovery He had begun by performing a two stage operation, but had given it up because he believed that the first stage—a wide lower thoracoplasty—gave rise to septic pleurisy and pneumonia He now used a one-stage lobectomy, preceding it by paralysis of the diaphragm, and had had only one death in six cases He had found that a local anaesthetic alone was generally sufficient He described the method of operation fully, through the opening of the intercostal pleura The separation of adhesions was generally without difficulty He left the smallest possible pedicle, applied two snares to control the bleeding and give support, and usually incised within three-quarters of an inch of the proximal snare Mr DICKSON WRIGHT (London) showed his instrument for implanting radium seeds Sir STCLAIR THOMSON (London) said he was very interested, as an onlooker, to see the further applications of the initial principle of rest Dr L S T BURRELL (London) expressed his belief that phrenic evulsion was indicated for movable mediastinum and for cases terminating in pneumothorax after three years Dr PARSONS (Toronto) described his method of forced drainage of bronchiectasis in children Lord MOYNIHAN (Leeds) said he had much enjoyed the discussion, and congratulated both the surgeons and the physicians Specialization must come as a growth of competent medicine and surgery, but he believed that the hope of the future lay in team work, the craft of surgery was complete, but the bounds had not been reached The opening speakers then replied, and Professor ARCHIBALD summed up the discussion

SECTION OF OBSTETRICS AND GYNAECOLOGY

Wednesday, August 27th

USES OF RADIUM IN GYNAECOLOGY

THE President, Mr COMYNS BERKELEY, opened the proceedings with an acknowledgement of the warm reception he had received in Winnipeg, and welcomed the visitors from the United States and other countries On behalf of overseas members he thanked the Canadian Medical Association for its hospitality Mr SIDNEY FORSDIKE (London) reviewed the present-day knowledge of the clinical properties of radium He described the various phases of enthusiasm through which gynaecologists had passed in the last thirty years, and stressed the fact that the standard of "cure" was so elastic that it was very difficult to compare the results of treatment in one centre with those in another Among the urgent problems of research at present none was more necessary for elucidation than the way in which radium acted, whether on the cell or stroma He strongly recommended that some of the radium provided for clinical research should be diverted to the equally important field of biological investigation In his opinion the primary action was on the stroma, the cell changes being only secondary, but further investigation was needed, since it was only by a full understanding of this problem that the dosage and method of application could be placed on a scientific basis Mr Forsdike briefly discussed the marked divergence of views on the question of split dosages and treatment of the glands, to show the chaotic position at present Reviewing the more clinical aspect of the uses of radium in gynaecology, he stated that no matter what might be the view regarding its effect in cancer, there was no denying its value in producing an artificial menopause, though differences of opinion existed as to dosage, and whether it was the endometrium or the ovaries which were affected He had recently been using a dosage of 53 mg of radium element, screened by 1 mm platinum, for twenty-two hours, and had obtained satisfactory results In his opinion there was no doubt that the ovaries were unaffected, and that the entire results arose from the action of radium on the endometrium He advocated very rarely the use of radium in the treatment of fibroids Mr Forsdike then discussed radium as a therapeutic agent in the treatment of carcinoma of the cervix uteri, as opposed

to operation in operable cases, and from the point of view of its value as a palliative agent He stressed the widely divergent methods of application, dosage, and standards of nomenclature used in determining "cures" He recorded his results in treating 181 cases from 1921 to 1925, in 134 inoperable cases there had been palliation and prolongation of life, but no cure, in 33 borderline cases 4 had been cured, of 14 operable cases 4 had been cured The rate of cure in all cases treated by radium was 4 5 per cent, and even in operable cases only 28 per cent Though he was a believer in the future of radium, he considered that operative treatment gave the best results in malignant cases and he foresaw a general resumption of treatment by operative surgery Professor W W CHIPMAN (Montreal) said that greater knowledge was required before realizing the value of radium, and greater care in its use was essential for success He discussed its application in combating cancer and in controlling uterine haemorrhage In the latter condition the value was greatest when the bleeding was intrinsic uterine haemorrhage from such conditions as subinvolution due to sepsis it had lesser value in fibroids and the bleeding of adolescence Radium acted by its effect, not only on the endometrium but also on the ovaries altering the hormonic output controlling menstruation It should not be used indiscriminately in cancer but only by those specially trained in its properties and application In his own clinic in Montreal between 1919 and 1929 only 289 cases had been treated, but the actual results were not known since his follow-up of the cases was not yet complete, moreover, a long enough interval had not yet elapsed in many of the later cases to be of value in estimating its efficiency as a curative agent His opinion of the position, however, was that all patients with carcinoma of the cervix should receive radium treatment if the condition was inoperable, and that at the present time radical operation seemed to offer more hope in the early and selective conditions He suggested that the effect of radium on cancer depended to a large extent on the actual resistance of the patient

TREATMENT OF THE LYMPHATIC GLANDS IN CARCINOMA OF THE CERVIX

Mr MALCOLM DONALDSON (London) discussed the treatment of lymphatic glands in carcinoma of the cervix emphasizing the point that while the original growth responded as a rule to radium treatment there had not been the same degree of satisfaction with the treatment of the gland metastases This might be due to insufficient irradiation of these areas and he had devised a method of direct application of radium to the pelvic glands in cases of carcinoma of the cervix He stressed, however the fact that the glands themselves would appear to be actually more radio-resistant than the original growth and he suggested that the glands did not act as areas of resistance in spreading the growth to generalized metastatic areas, but actually as centres in which the malignant cells could grow more rapidly This view was supported by the fact that while cancer cells were found in the lymphatics it was not until the glands were reached that any large deposits of cancer appeared moreover it had been shown that tonsillar extract contained a definite growth producing substance for tissue culture He discussed the questions whether radium acted by direct effect on the cells and whether its action was due to the effect on surrounding cells If the action was indirect it might well be that the effect of radium on glandular tissue was far less than on other cells of the body After this review of the biological problems of radio-activity Mr Donaldson outlined the various ways in which glandular metastases in malignant disease of the cervix uteri had been attacked—namely by operation x rays and the direct application of radium by the external and internal peritoneal routes He described his modification of the Brussels methods of introduction as used in thirteen cases subsequently He showed a chart of the results obtained in 1923-24, and detailed the procedure he had adopted in thirty-eight cases but explained that sufficient time had not yet elapsed for definite conclusions to be drawn as to the remote results of this method of treatment He disagreed with Mr Forsdike's view that radium did not affect the ovaries but considered that this was an important factor, further laboratory research was necessary before drawing any final conclusions as to its place in medicine Sir EWEN MACLEAN (Cardiff) mentioned the perils attending the indiscriminate use of radium by those not specially skilled and trained in its application Mr GORDON FICKER (London) stated that after an extensive use of radium he felt that the best result in carcinoma of the cervix followed radical surgery Dame LOUISE MCILROY (London) thought that by treating patients with radium in cancer cases many would be encouraged to apply early, undeterred by the fear that hysterectomy would be performed for symptoms suggesting cancer More knowledge was required about the individual case before applying radium therapeutically, in order to prevent some of the immediate serious consequences Mr T G STEVENS (London) remarked that the discussion so far had been mainly theoretical, a few practical hints would be of value to many present He thought that radium should be distributed at the introducing end of the applicating needle rather than in the middle He deprecated the use of emanation tubes which he considered valueless the services of a physicist were essential to control the actual dosage As regards the area of activity he was sure that the ovaries were the main organs affected in cases of menopausal bleeding, and not only the endometrium, which suffered partial and not complete destruction.

The President, Mr COMYNS BERKELEY, continuing the discussion, said the position of radium with respect to other methods of treating cancer of the uterus was not yet fully clear, its determination necessitated the analysis of a large series of cases extending over many years, possibly as many as ten Such an analysis could be of value only if when dealing with various cases of the disease in a particular organ very careful reports were made by all the medical men concerned on the same lines and on similar case sheets, including, whenever possible, a note of the after-history up to ten years or death if such should occur during this time According to the published results of certain Continental clinics, the treatment by radium of cancer of the cervix had been more successful than in any other part of the body The results, however from these various clinics, and especially from those in England were very unequal For some years now there had been two schools of practice dealing with cancer of the cervix—that of surgery and that of radiotherapy An examination of the published results of authorities in each method of treatment disclosed the fact that the percentage of cures (freedom from recurrence after five years) was somewhat larger after the radical operation, but that the primary mortality was much higher In fact the primary mortality with radiotherapy compared with that following the radical operation might for statistical purposes be regarded as negligible To arrive at a definite decision as to the best method of treatment from a comparison of the two methods was not, however, a simple matter Just as the results of any particular surgeon should be based on the knowledge of his operability rate only—that was the number of completed radical operations he performed out of the total number of cases on which his advice was sought—so the value of the result of the radium therapist should be based on the knowledge of his radium rate only—namely to how many cases did he give the full treatment out of every case on which his advice was sought even if any of the patients were in extremis Many surgeons whose statistics were sufficiently exhaustive to be relied upon maintained that the published result of radium treatment could not in all cases at any rate be fairly compared with those of the radical operation since such strict records were not obtainable and that therefore the sample of radiotherapeutic cases might well have been one of a less advanced nature In his hands he surgeon gave more patient a chance when taught account in a great measure for the primary mortality The argument that the operability rate was a personal factor depending on the judgment and skill of the operator and that it therefore did not assume the importance which had been claimed for it when a comparison was being made of the two methods was fallacious, since any authority on the treatment of cancer of the

cervix knew that if a surgeon completed the radical operation on 65 out of every 100 women he saw, he must be operating on very advanced cases as well as on others

It seemed almost impossible to reach a classification of the extent of the disease which would enable a comparison to be made between the various methods and the various clinicians Although not by any means perfect, the classification of the League of Nations into four stages appeared to be the best available at present, it had been adopted by all Continental nations and by all the centres of the National Radium Commission It might appear easy to divide cases into operable and non-operable, but to assess the value of such a division one must know the operability rate of the surgeon reporting his results The majority of surgeons had not given their operability rate when publishing their figures The division of cures by the pure radiologist into operable and non-operable was futile, since he had no means of knowing from personal experience which cases were operable and which were not *Although, therefore, the classification into four stages was* undoubtedly the best at present, the diagnosis of the exact stage of the disease in any particular patient must always remain a personal factor of the medical practitioner treating the patient, the most difficult stages to separate being the second and third in certain cases A final judgement as to the value of treatment by radium could be given only when it was specifically stated, in the reports *from each clinic, (1) how many patients were seen by the* medical officer as out-patients, in-patients, or in consultation, (2) how many of them received the full treatment, (3) how many were incompletely treated, (4) how many were refused treatment, (5) the *reason for the incomplete* treatments, (6) the reason for refusing any treatment With respect to the best treatment of the glands the President added that he had an open mind, more especially as regards the early cases, since it was known that cancer of the cervix differed somewhat remarkably from cancer in other situations, in that glandular infection was comparatively late In all his radical operations he had had the glands examined, and many times he had been struck with the fact that in what was an apparently somewhat advanced case the glands were free from involvement Enlarged glands were not rarely inflammatory in nature He kept his mind open because at the two greatest centres for radium treatment—namely, at Stockholm and Paris—although the cure rate in both had been practically the same, in Stockholm, until recently, the glands had not been treated, while in Paris they had Professor Heyman had stated that he was now treating the glands, with the idea that he would get better results with the advanced cases If this turned out to be the case, it would suggest that the Stockholm method was superior to that of Paris, apart from the treatment of the glands, this might be substantiated now that the glands were being treated

SECTION OF BACTERIOLOGY, PATHOLOGY, PHYSIOLOGY AND BIOCHEMISTRY

Wednesday, August 27th

THE Section met under the presidency of Professor ROBERT MUIR of Glasgow, who conveyed the most cordial greetings of the workers in these subjects in Great Britain to those in Canada, and the regrets of many who had been unable to make the journey He voiced the appreciation of his companions for the Canadian hospitality which had been extended to them ever since their arrival in Quebec

MELANIN AND MELANOSIS

Professor JAMES EWING (New York City) opened a discussion on the physiology and pathology of melanin, dealing particularly with melanoma He referred to new light that had been thrown upon the subject by the brilliant procedures and results of Professors Masson and Sinnard of the Université de Montreal, and classed melanoma as a disease of the peripheral nervous system While admitting that his theory could not be regarded as established, and conceding that pigment formation could occur in epithelial cells, he emphasized the difference in behaviour between the cells responsible for the development of true melanoma and those in other types of melanotic tumours, stating that he did not consider epithelium to be the actively functioning type of cell in the former condition

Professor MATTHEW J STEWART (Leeds University) dealt particularly with melanosis of the colon, the now well recognized condition of the large intestine in which a deposition of melanin or melanin-like pigment appeared in the mucous membrane of the gut He briefly reviewed the earlier literature, pointing out that the earliest description of the condition was given just over a century ago, the first case was reported in England in 1867 Most of the recent work on the subject was German (Edgar, 1898, Pick, 1911, etc) Heuschen and Bergstrand published a careful and complete study in 1913, and Lubarsch and Borchardt thoroughly reviewed the subject in 1929 His own observations were based on two groups of cases an unselected series of 600 necropsies at all ages, and a consecutive series of 100 cases of carcinoma of the colon In the first group the whole length of the alimentary canal was subjected to close naked-eye inspection, but only selected examples were examined microscopically, in the second all the cases were submitted to histological examination In the first, 11 2 per cent exhibited melanosis of the colon, in the second, 55 cases showed the condition, and it was discovered in 13 others microscopically (Heuschen and Bergstrand found 4 naked-eye and 61 microscopic examples in 225 consecutive necropsies) The condition was rarely seen under the age of 30, and became increasingly common after the age of 60 There was no significant difference in distribution between the sexes In the second series (carcinoma of the colon) the importance of the part played by obstruction in the causation of melanosis was shown not only by the relatively much higher incidence in these cases, but also by the fact that the pigmentation tended to be more intense above than below the growth This was so in 33 out of 59 cases In 17 others pigmentation was present only in the upper segment The morbid anatomy of melanosis of the colon was well established The colour of the affected mucosa ranged from greyish or buff stippling through dark grey or brown to intense black The distribution was characteristic, almost invariably the pigmentation was deepest in the caecum and colon, becoming gradually less intense on passing down the gut, in very advanced cases dark brown or black pigmentation might extend to the anus The pigmentation was sharply delimited above by the ileo-caecal valve, though Heuschen and Bergstrand were able in 9 of their cases to demonstrate melanin granules microscopically in the mucosa of the lower ileum Histologically, in the great majority of cases the pigment was confined to the mucous membrane, where it lay within the cytoplasm of large monocular cells whose precise nature was still unsettled Appearances suggested that the formation of melanin took place mainly in the surface zone, with a later downward migration of the melanin-containing cells The epithelium of the mucosa, whether superficial or glandular, was invariably pigment-free, and the solitary follicles of lymphoid tissue were usually so In a few cases little groups of pigment cells could be seen on the deep side of the muscularis mucosae, and metastasis of pigment to the mesocolic lymph glands also occurred Recent workers had more or less agreed that the pigment was either a true melanin or intermediate between a melanin and a lipofuscin (or wear and tear pigment) The chief differences between it and skin melanin were that it was more slowly soluble in antiformin and was bleached more slowly by hydrogen peroxide Since Pick and Brahm found that the pigment from a typical case of melanosis in a woman of 23 showed the same solubility in warm 5 per cent sodium hydroxide as skin melanin, while that from older persons was negligibly soluble, they suggested that melanin changed in composition with the passage of time Pick's theory of the source of the pigment now met with general acceptance, aromatic protein disintegration products absorbed from the large intestine were converted into melanin within the connective tissue cells by a tyrosinase-like ferment This explained equally the importance of prolonged constipation as an etiological factor, since it led to excessive putrefaction in the large gut, the virtual limitation of the process to the colonic

mucosa, and the tendency for the pigmentation to be most intense in the caecum and ascending colon, where absorption was greatest

Dr SEYMOUR HADWEN (veterinary pathologist to the Ontario Research Foundation) dealt with melanin formation in animals. He considered that animals were coloured primarily for reasons connected with health. An Arctic animal, such as the snowshoe rabbit, was coloured white externally for warmth. Its coat had four bands of colour, both to attract and to retain heat. The change to white in autumn was structural and not a depigmentation. Stimulation through injury, bites of insects or bacterial action might intensify hair colour, or else the cells might be injured sufficiently to prevent production of colour. The change from black to white in animals bearing albinotic patches was very delicate, and ended with two cells lying side by side, one producing colour, the other not. Albinotic cells could reproduce themselves and were strongly inherited. Freckles occurred only in old horses, not in young animals. Horses which became white with age and freckled horses invariably had melanotic tumours. Melanotic deposits were common in all part of the body, but frequently the masses were seen in avascular situations such as the periosteum, tendons, and serous coats. There was usually no connexion between the tumours and the epidermis. Extensions of the pigmented masses might arise in some cases through pressure from the harness, and were not due to malignancy.

Professor A. T. CAMERON (Winnipeg), dealing with the biochemistry of melanin, pointed out the need for defining melanin more accurately, and the danger that at present existed through the uncritical tendency so to term any brown or black pigment which exhibited certain physical properties. The analyses of melanins from various sources showed such wide variations as to be valueless. Melanins contained carbon, hydrogen, oxygen, and nitrogen, but it was doubtful if pure melanin contained sulphur or other elements. The most outstanding recent contributions to the biochemistry of the subject were the work of Professor Raper and his colleagues on the action of tyrosinase on tyrosine, and the discovery by Professor Bruno Bloch of a specific enzyme dopa-oxidase, which acted upon 'dopa' (dihydroxy phenylalanine). Raper had shown that tyrosinase acted on the amino-acid tyrosine in presence of air to produce initially "dopa," this changing to an indole derivative which was decarboxylated to a red compound. The action of the enzyme ceased at this point, but further slow oxidation ensued through a colourless stage to dihydroxy indole, which was further oxidized and polymerized to melanin. Bloch's dopa-oxidase, starting with the tyrosine derivative "dopa," probably acted through the same stages. Since two of the purest melanins so far obtained—that prepared from tyrosine by the action of tyrosinase, and that from the urine of melanotic patients by the oxidizing action of potassium persulphate—both contained no sulphur and practically the same percentage of nitrogen, and since Raper had found that melanin from the skin of a negro, and the "ink" of the squid, and from a melanotic tumour, showed no essential difference, it would appear that many melanins were if not identical, of very similar chemical nature. Melanogen, the colourless precursor, might be the simple indole derivative formed from Raper's red compound or a substance similar in complexity to melanin itself. There were insufficient data to settle this point. The pigment in Addison's disease was possibly derived from an adrenaline precursor, as Bloch suggested, but more probably was due to failure in output from the adrenal cortex of a product which inhibits pigment formation. In regard to the work of the Italian school, suggesting pyrrol as the precursor of melanin, the available evidence appeared on the whole to be adverse to this view.

Professor G. S. WILSON (London School of Hygiene and Tropical Medicine) read a paper on the diagnosis of undulant fever. He dealt critically with the methods at present available for the diagnosis of *Brucella* infections. He pointed out that the interpretation of a positive agglutination reaction was often a matter of considerable difficulty, demanding close co-operation between the clinician and the bacteriologist, and stressed the necessity of testing a series of dilutions of serum, stating the correct interpretation of various types of result. The agglutination test was of very real value, but by no means infallible. The blood culture method led through the isolation of the infecting organism to the most satisfactory way of establishing the diagnosis, repeated blood cultures might be necessary, and success was by no means uniform. In an infant fever due to *Br. melitensis*, the organism could usually be recovered sooner or later, when the disease was due to the bovine type of *abortus* failure was often met with. Methods involving cultivation from material other than blood, animal inoculation, and the intradermal reaction were also critically discussed. Professor JAMES MILLER (Kingston, Ontario) referred briefly to conditions in Eastern Canada.

Sir KENNETH GOADBY read a paper on the chemical composition and fractionation of the *Staphylococcus aureus*. From a culture on agar he had prepared, he said, an ether extract of a lipoid nature which injected into the skin reproduced the condition of carbuncle minus the suppuration. He suggested that such fractions might have useful employment in vaccine therapy.

SECTION OF PREVENTIVE MEDICINE.

Wednesday, August 27th.

THE TRAINING OF PUBLIC HEALTH PERSONNEL.

UNDER the chairmanship of the President, Dr. A. S. MACGREGOR (Glasgow), the whole morning was devoted to a symposium of "The development of a well-trained public health personnel." Professor J. G. FITZGERALD (Toronto), *in his general introduction, examined in turn the variety* of types of health worker and the courses available for their instruction at university colleges. He considered the special requirements for those non-medical workers seeking higher degrees in public health, the needs of the public health engineer, the public health nurse, the sanitary inspector, the veterinary inspector, the medical graduate, and the undergraduate medical student. An account was given of the medical students' course established in 1924 in the University of Toronto. The general subject was then considered under five subheadings.

Discussing undergraduate medical training in public health, Dr. A. GRANT FLEMING (Montreal) described in some detail the course now presented at McGill University. This sought to provide a minimum factual knowledge, to show the student the field of work, and to bring home to him his responsibility for applying this knowledge. It was intended that the preventive aspect of medicine should permeate all the medical teaching. The objects of the special department were presented to the student throughout the whole five years of his medical training, so as to integrate with his clinical and other studies. In a review of special or post-graduate public health training, Dr. DONALD T. FRASER stressed the need for expert technical assistants, who on working for an appropriate B.A. degree should be qualifying themselves to obtain positions in the public health service without the need of further study. The role of the public health nurse was considered in some detail, together with the course now available for her in Canadian universities. The qualifications of candidates for post-graduate degrees or diplomas in public health were examined together with the content of courses offered. Dr. JAMES RUSSELL ROBERTS (Ontario) said that in many parts of Canada the education and preliminary training of the sanitary inspector was neither satisfactory at the present time nor did it hold out hope for the immediate future. Frequently this official was too Cinderella of the health department, dreaming among the ashes of the past. Dr. Roberts described the highly important work awaiting the sanitary inspector who was a technical expert, and discussed a suitable curriculum for training, which in his view should be related to the work of the provincial universities. In an extempore address on the midwife, her training, supervision, and conditions of service, Sir T. EUSTACE HILL (Durham) referred to the fact that in none of the excellent papers to which he had listened was any reference made to the position of the midwife. He concluded thus: that the midwife had no place in the Canadian Health Service—was not controlled and

was not certified In England, owing to high maternal mortality and high neo-natal mortality death rates, this matter was receiving constant attention, and had been the subject of *important reports by departmental committees*, the British Medical Association, and the Women's Medical Federation It was recognized in Great Britain that much of the maternal mortality and neo-natal mortality could be prevented by an efficient midwifery service, which meant the availability of a doctor and trained midwife to every expectant mother In Canada, or at any rate in the province of Saskatchewan, the maternal mortality was considerably above the persistently high rate of England and Wales The speaker referred to the low maternal mortality in certain poor districts in London, and in well-administered maternity homes and hospitals, and especially when trained nurse midwifery services were available through nursing institutions, a large proportion being supplied by the Queen's Institute of District Nursing After enumerating the essential factors in connexion with the training, supervision, and conditions of service of midwives, in respect of which he stressed the importance of the adoption of the recommendations of the Departmental Committee on the Training of Midwives, Sir Eustace Hill said that after passing the examination of the Central Midwives Board the midwife should have three months' practical training in a maternity home, or under an approved highly trained midwife, before being allowed to practise He urged Canadian health officers and others to give the question of an efficient midwives service careful consideration, and strongly advised them to study the reports of the departmental committees, and the Memorandum of the British Medical Association on a National Maternity Service He pointed out that in England 70 per cent of maternity cases were attended by midwives, who had to call in medical assistance should the patient have any abnormality or complication, and that the British Medical Association, in its memorandum, agreed that more cases of midwifery might be safely left to the midwife subject to necessary medical assistance and supervision being available

Discussing the training of the health visitor, Dr F C MIDDLETON (Saskatchewan) said that preliminary education for the teaching of health should be at least equivalent to that of a girl entering the teaching profession Her training course should be at an approved hospital Personality was of fundamental importance Modern tendencies in the course of instruction were examined, and the part played by the Victorian Order of Nurses for Canada and the Rockefeller Foundation of New York in furthering the training of health visitors was described

With the exception of Sir T Eustace Hill's contribution the opening papers will be published in full in subsequent numbers of the *Journal* A general discussion followed the reading of the papers, most of the speakers concentrating on the subject of the midwives service The Hon Dr E W MONTGOMERY, Minister of Health, Manitoba, said that in Manitoba there was great difficulty in establishing full-time rural public health units, because the farmers in sparsely populated districts were not yet prepared to finance schemes The provincial maternal mortality rate had fallen, but it was still excessive, the proportion of deaths in small hospitals was unduly high Dr JOHN W BONE (Luton) stated that the great hopes aroused by the various Midwives Acts had not been fulfilled In his view they had failed to secure the right type of women to act as midwives, most of the best types who qualified never actually practised Preliminary general education was necessary, and post-graduate refresher courses should be freely available for all practising midwives Only thus might they hope to reach the position of countries like Holland and Denmark, where a reduction of the mortality rate to about 2 had been effected With regard to experience in Manitoba, the highest proportion of deaths was in small hospitals, he remarked that this concurred with the opinion of the British Medical Association that the safest place for the normal confinement was in the home, and that the hospital was only necessary for an abnormal case or where the home conditions were unsuitable Small hospitals were very dangerous unless properly constructed, suitably equipped, and, what was of still greater importance, every member of the staff was expert in aseptic and antiseptic methods

Dr ROSE MOLLOY (Birmingham) thought it important to attract to the profession of midwifery women of better general education than was customary to-day Status and salary at present were not sufficiently attractive to induce the best type of women to become midwives A more thorough system of training should be evolved, as more harm might be done by half-trained midwives than by even untrained women Inspectors of midwives ought to act in an advisory capacity rather than be critics, and inspectors of midwives ought to be physicians who had had practice and experience in midwifery Dr PRIOR (maternal and child hygienist, Department of Health, Ontario) said that there was no public demand in Ontario for a midwives service From information available there was no large group of pregnant women in that province not receiving medical service The maternal mortality rate was extremely high, a general interest was being shown by the profession, health authorities, and the public in the solution of the problem, and the possible place of the well-qualified midwife warranted consideration by these interested groups Dr DOUGLAS (Winnipeg) stressed the importance of impressing on medical students that the general practitioner could be of great assistance in carrying out the programme of modern preventive medicine among his patients The trained sanitary inspector was one of the most valuable agents in spreading health propaganda Dr A S M MACGREGOR (Glasgow) spoke of the excellent schemes of undergraduate medical training in Canada as exemplified at Toronto, and of the changes required to modify the conventional D P H course, so as to lay stress on applied physiology He anticipated the development of municipal midwifery services For the health visitor the first qualification was her temperament He commended to the Minister of Health of Manitoba the experience of the Highlands and Islands service of Scotland, which might aid him in dealing with the rural problems of Manitoba

In reply, Professor FITZGERALD said that in Canada the problem of maternal mortality was viewed with as great concern as in the Mother Country, and yet puerperal fever was increasing rather than decreasing Sir EUSTACE HILL, in his reply, stated that the medical profession was significantly to blame for the present maternal mortality rate, and that it was unfair to throw this, even by implication, on the midwife

SECTION OF MENTAL DISEASES AND NEUROLOGY

Wednesday, August 27th

ABNORMAL MENTAL AND NERVOUS CONDITIONS AT THE MENOPAUSE

THE President of the Section, Sir FARQUHAR BUZZARD, acting as chairman, opened the session with a *graceful* tribute to the modesty and generosity of the Canadians in allocating to them visitors the position of honour He then introduced Dr GEORGE RIDDOCH (London), who opened the subject by first defining the term climacteric, or involutional period, and thus describing the commoner changes undergone by both men and women during this phase of their lives He dwelt at considerable length on the physiology of this period, drawing attention to the changes that occur in the functional activity of the so-called ductless glands, and to the manner in which the activity of the autonomic nervous system is changed so as to account, in part at least, for the emotional symptoms which are so constantly a part of the picture in menopausal states Emotional, vasomotor, and nervous symptoms of the normal climacteric he discussed under the headings premenopausal, menopausal, and post-menopausal, pointing out that in the majority of cases mental and physical symptoms did not put in an appearance at the same time Although emotional disturbances at this time of life were fairly common, the speaker wished to emphasize that many women were able to undergo the transition to middle age so easily that their symptoms barely disturbed "the even tenor of their way" On the other hand, some were harder hit, and were unable to face the change of life without a breakdown in both physical and mental health The etiological factors in these cases

were discussed at length under the following headings (1) constitution and temperament, (2) the emotional and physical background of the woman's life, (3) preconceived notions about the climacteric Mental states associated with the menopause were classified by the speaker, according to their severity, as psychoneuroses and psychoses In the psychoneurotic he maintained the symptoms were simply a magnification of disturbances that can be considered as normal at this time of life Among the psychoses he considered that melancholia was by far the most common, representing about 66 per cent of psychotic syndromes at the climacteric Other varieties of mental disorder were referred to as chronic paranoid states and confusional insanities In considering factors influencing the prognosis Dr Riddoch stated that, on the whole, the outlook for recovery was good, the duration of illness in recoverable cases being between six and nine months The paper was concluded with remarks on treatment under the headings of prophylaxis, glandular therapy and psychotherapy

Dr C B FARRAR (Toronto) continued the discussion by presenting a very interesting and instructive series of charts which had been compiled from statistics obtained in the study of cases at the Toronto Psychiatric Hospital Chart 1 showed the relation between the numbers of men and women admitted during a two-year period and the number of both sexes in the community population Chart 2 illustrated the ages of females at the time of admission The peak was shown to be between 20 and 25 with only a slight rise at the involution period Chart 3 showed that in the case of male admissions the peak was reached at between 30 and 35 Chart 4 showed the admissions according to type of psychosis, and it was pointed out that in 36 3 per cent the mental disorders were associated with the involutional period The fifth chart showed the relation in time between occurrence of mental and of physical symptoms in involutional states The sixth chart classified the cases according to diagnosis, and the seventh listed the outstanding etiological factors in menopausal states as follows exaggerations of constitutional traits, physiology of menopause, habitual menstrual variations, early involutional changes psychology of menopause, and factors independent of life epoch The eighth chart indicated physical disabilities found in the series and the ninth was an analysis according to physical types—namely, pyknic and asthenic The former types were noted as being in the minority The last chart illustrated the prognosis, and it was pointed out that in the series three-quarters of the cases had recovered

Dr C A BARAGER (Brandon) expressed his appreciation of both addresses stating that if his opinions did not appear to agree with those of the speakers it would be because his experience in a provincial hospital had been in dealing with more advanced cases The depressive-apprehensive type of depression he considered to be the commonest mental disorder associated with the involutional period, and he thought it was rather more frequent among women He differentiated between cases in which there was a history of a former depression and those in which there was none, and considered that the prognosis in the former group was very much better than in the latter He laid considerable stress on cases of mental disorder of the involutional period in which the symptoms were outstandingly schizoid, and referred to them as late praecox syndromes He considered that former speakers had not emphasized the psychological factors in the etiology of involutional states People at this time of life underwent a tremendous change in outlook which undoubtedly in many cases was so great as to be an important etiological factor in the development of their state Dr J G McKAY (Vancouver) prefaced his remarks by saying that his viewpoint would be that of a consultant In private practice the one thing in which relatives were most interested was prognosis, and he wished to know just how one could distinguish between psychoneurotic and psychotic states Dr R G ARMOUR (Toronto) confined his remarks largely to therapy as applied in private practice and in hospital Many patients he thought got better much more quickly under supervision in a mental hospital than they did elsewhere

In replying, Dr RIDDOCH admitted that it was extremely difficult to draw the line between psychoneurotic and psychotic cases Psychoneurotics, he thought were in reality mild cases of melancholia The outstanding differential feature between the milder and more severe cases, he considered, was that in true psychotics the patient always takes the blame for misfortunes whereas psychoneurotics project their troubles and tend to lay the blame on others The psychoneurotic also is more prone to emotionalism and tearfulness, the psychotic is beyond this point of being able to express herself emotionally Dr C B FARRAR in his closing remarks brought out several points of differentiation between mild and more severe cases and pointed out that early institutional care should be advised where there was anything suggestive of suicidal tendencies

SECTION OF ANAESTHETICS

Wednesday August 27th

ANAESTHESIA FOR OPERATIONS ON THE GRAVID UTERUS

Dr RAYMOND E APPLEBY (London) the President opened the proceedings by thanking the members of the Canadian Medical Association for the cordial welcome extended to members of their British counterpart He had also brought greetings from the Section of Anaesthetics of the Royal Society of Medicine Dr H W FEATHERSTONE (Birmingham) read a paper on anaesthesia for operations upon the gravid uterus, outlining the various methods used and stressing the importance of spinal anaesthesia in these circumstances He was convinced that this method possessed distinct advantages in certain cases, but for routine work it would be difficult to displace nitrous oxide and oxygen Dr S JOHNSTON (Toronto) considered that both pre medication and post-medication were most important factors He also expressed the opinion that nitrous oxide and oxygen proved of the utmost value in this type of work An analysis of 150 operations performed upon pregnant women under this anaesthetic at Toronto General Hospital showed that the highest mortality occurred in toxic patients Dr Johnston regarded chloroform as a dangerous drug in no circumstances would he allow a patient in labour to administer it to herself If he were handicapped by lack of assistance he would first give ether and then carry out any necessary operative measures He did not agree with the statement that ether generally caused secretion bubbling and cyanosis if it was given carefully by the drop method there should be little or no cyanosis He had found spinal anaesthesia of great value in diabetic patients but in those with cardiac conditions a great deal depended upon the extent of the lesion Professor W WEBSTER (Winnipeg) thought that in pregnancy an anaesthetic which was both absorbed and excreted rapidly was of prime importance he therefore regarded ethylene and nitrous oxide of great value and it was his practice to use one of these as an analgesic He objected to spinal anaesthesia for the reason that it contracted the circular muscle of the uterus and was therefore prone to delay labour Dr BOTSFORD (San Francisco) agreed that the administration of nitrous oxide and oxygen was absolutely safe She did not practise pre-operative medication because she regarded it as having a deleterious effect upon the child Ether was used in addition when labour was prolonged but just before the child was born the mother was flooded with oxygen Sodium amytal was helpful to the mother the drug producing a condition resembling scopolamine-morphine narcosis Several fatalities had occurred however in the case of the child Dr D LAMB (Glasgow) on behalf of the Scottish Society of Anaesthetists thanked the Canadian Medical Association for its hospitality He commented on the different conditions under which midwifery was practised in North America and in the British Isles The administration of nitrous oxide must be confined of necessity to hospitals while for domestic midwifery nothing equalled the administration of small whiffs of chloroform This could be done by the patient herself it was perfectly safe and effective and the popularity of this method spoke for itself Dr R WATERS (Madison Wisconsin) stated that chloroform was largely used in midwifery in American rural districts He considered that when spinal anaesthesia was employed oxygen and carbon dioxide should be used in addition, to maintain

correct alveolar balance Dr J S LUNDY (Rochester, Minn) said that recently it had been shown that chloroform had very little effect upon newly formed liver tissue, this probably accounted for the innocuousness of this anaesthetic as regards the foetus The PRESIDENT commented upon Dr Lundy's statement Some years ago he had investigated the action of chloroform upon liver tissue, and he had found that some livers were damaged more easily than others Perhaps Dr Lundy had indicated the true explanation He used spinal anaesthesia in cases complicated with cardiac disease, but thought nitrous oxide and oxygen the ideal anaesthetic for pregnancy

TECHNIQUE IN ENDOTRACHEAL ANAESTHESIA

Dr I W MAGILL (London), in a paper, reviewed the methods of endotracheal anaesthesia commonly employed, and described a method of nasal intubation which he had used for the past eleven years with considerable success Dr R WATERS (Madison, Wisconsin) wondered if Dr Magill had used CO_2 to separate the vocal cords He also inquired if he employed morphine or other pre-operative medication He did not like the two-tube method because it tended to wash out CO_2 from the patient, he preferred the single-tube method, with to and fro respiration Dr Waters described an inflatable attachment, encircling the catheter, and used to plug the pharynx Dr R HARGRAVE (Toronto) asked if Dr Magill had experienced difficulty in connexion with preliminary cocainization of the larynx He had never employed nasal intubation Dr S JOHNSTON (Toronto) described a case in which sudden cyanosis and death occurred during endotracheal gas and oxygen anaesthesia, and inquired if Dr Magill could put forward any explanation Dr BLEZARD (Edmonton, Alberta) put the question whether nitrous oxide produced sufficiently deep anaesthesia for intubation, and Dr HAYES (New Zealand) whether Dr Magill interrupted the flow of gases, and at what period the tube was removed Dr E I MCKESSON (Toledo, Ohio) believed that a great future existed for nasal intubation He had experimented with the subject, but Dr Magill's methods had convinced him that he was working on the wrong lines In America there was scope for improvement in intratracheal anaesthetics As Dr Magill had pointed out, the position of the tip of the catheter should be visualized Dr LUNDY (Rochester, Minnesota) considered that sudden pressure upon the posterior pharyngeal wall was not devoid of risk He described a case in which sudden death occurred during this manœuvre Dr FEATHERSTONE (Birmingham) inquired whether there was any risk of trachitis He had seen cases in which the catheter had passed into the œsophagus Dr BOTSFORD (San Francisco) described a method of passing the catheter indirectly by means of a stylet Dr H SHIELDS (Toronto) said he was impressed by the simplicity of Dr Magill's method, and by its adaptability to oral and pharyngeal operations In reply, Dr MAGILL said that he did not hesitate to employ CO_2 to widen the vocal cords, or to employ premedication The anaesthetic was delivered at a low pressure He had seen no ill effects from the use of cocaine In conclusion, he said that the main point was dexterity in passing the catheter, it should be well lubricated with vaseline

SECTION OF ORTHOPAEDICS

Wednesday, August 27th

TREATMENT OF CONGENITAL DISLOCATION OF THE HIP

AT the first meeting of this Section the chair was taken by the President, Mr E LAMING EVANS, and Mr H P H GALLOWAY (Winnipeg) opened the discussion with a paper that is printed in full at page 409, on the treatment of congenital dislocation of the hip MR LAMING EVANS reported the results of manipulative treatment in a series of twenty-five patients with thirty-two dislocated hips, who had been treated not less than ten years previously They had been examined within the last few weeks, and the functional results reported were bad, 1, poor, 2, good, 13, perfect, 19 The good results included one anterior transposition and five eccentric nearthroses The average shortening was less than half an inch, though in a series of fifty untreated congenital hip dislocations with the average age of patient 25, the average shortening was 2½ inches Manipulation should always be very gentle, and if the first attempt failed two further attempts were made after intervals of seven to ten days If reduction was still not accomplished, capsulotomy was indicated

MR WATSON JONES (Liverpool) said that the strongest argument Mr Galloway had brought forward was the freedom from trauma which his methods entailed But Putti had shown us that if a case could be diagnosed within a month or two of birth it could be completely cured by simple abduction of the hips There was practically no manipulation and therefore no trauma at all Between this type of case and the definitely irreducible hip of the adult, there must be a certain proportion of cases reducible by manipulation without trauma Manipulative treatment should be bloodless, and, provided that no force was used, a simple manipulation did not interfere with subsequent operative treatment Dr T HARTLEY MARTIN (Leasowe) described the application of Putti's method in treating congenital dislocation of the hip in three patients under 12 months of age In two cases reduction was effected in three months, and in the third case, which was that of a delicate premature child, the dislocation was reduced in twelve months The secret of success lay in early recognition, and under such circumstances there was no necessity for operation Mr W A COCHRANE (Edinburgh) said that though operative treatment might be quite safe in the hands of the specialist, we had to legislate also for the general surgeon and the practitioner Furthermore, conservative measures have advanced coincidently with operative methods The speaker preferred Denuce's manipulative method because it was so gentle, and in the few cases in which operation was carried out, Kocher's posterior approach was utilized Dr GALLIE (Toronto) said that his practice had been strongly affected by a case he had seen in which operative reduction had been complicated by very severe infection of the wound and joint He reported eighteen private patients suffering from congenital hip dislocation which had been treated by manipulation, and perfect functional results had been secured in all cases but one He thought that though operation was quite safe in the hands of Mr Galloway, the average results in the hands of all practitioners were better by manipulation than by operation Dr HENDERSON (Mayo Clinic) said that Dr Galloway was pursuing the only fair course for a scientific investigation Every case he saw was being treated by operation, so that a true interpretation of the results of operative treatment would be possible In the speaker's own practice, operative methods were only used when manipulative methods had failed, and in this group of cases the results were very poor

DR GALLOWAY, in replying to the discussion, said that the late changes in the head and neck of the femur and in the acetabulum which had been observed in some of Mr Laming Evans's cases were due to decalcification and to poor resistance owing to long functional disuse during treatment The speakers in the discussion had shown him that the surgeons who were practising manipulative methods to-day had made wide departures from the original methods of Lorenz, and for these reasons the objections to manipulation methods lost a good deal of their force The whole problem became one of early diagnosis, and considerable onus lay on the obstetrician who examined newly born infants with a view to excluding congenital defects

DR A GIBSON (Winnipeg) read a short paper on semilunar cartilages He said that removal of the internal semilunar cartilage usually entailed no subsequent disability, and experiments in dogs had shown that after a meniscotomy the cartilage might be replaced by dense fibrous tissue, so as to be indistinguishable from the original cartilage Specimens were shown of cysts of the external semilunar cartilage They were probably not congenital, but arose from the synovial sheath covering the popliteus tendon, part of which had frequently to be removed Cyst formation and calcification in fibrous tissue were also shown in cases of tennis elbow, and in the supraspinatus tendon Radiograms of calcification in the semilunar cartilages of the knee-joint, and in the triangular fibro-cartilage of the wrist, were also shown

British Medical Journal.

SATURDAY, SEPTEMBER 13TH, 1930

CONGENITAL DISLOCATION OF THE HIP

It may seem strange that the treatment of congenital dislocation of the hip should still offer ground for discussion not merely about detail, but about fundamental principles, yet, as it cannot be denied that such discussion is necessary, we congratulate the Section of Orthopaedics on having chosen this subject for one of its full dress debates at the Annual Meeting of the British Medical Association in Winnipeg. The section was fortunate in the opener of the discussion, Dr Herbert P. H. Galloway of Winnipeg, for not only is he recognized as an authority on orthopaedic surgery, but on the subject of congenital dislocation of the hip he holds clear-cut and strong opinions which are likely to stimulate controversy and thus, it may be hoped, lead to progress. Dr Galloway's opening paper is published in full in this issue at page 409, and a report of the interesting discussion that followed appears at page 434.

Whether from the standpoint of anatomy and pathology, or from that of etiology, congenital dislocation of the hip presents problems which make its study peculiarly interesting. Its preponderant incidence in females, its preference for certain races and countries, the possible significance of developmental aberrations in its causation, have all raised questions which have not yet been satisfactorily answered. Pravaz, who was perhaps the first to claim to have cured the disability believed that the foggy sky and damp climate of Great Britain favoured the production of deformities in general, yet it is not here that cases of congenital dislocation are plentiful, but in 'sunny' France and Italy. A few years ago Dr Le Damany estimated the cases in France at 200,000, and this figure was accepted by Professor Potel in his *Traité pratique d'orthopédie*.[1] Professor Putti of Bologna and Professor Galleazi of Milan between them treat 1,000 cases yearly, whereas it may be safely assumed that the cases treated in London in any one year would seldom exceed one hundred. In the United States many cases are met with among the children of immigrant Italians and other continental Europeans, but data are lacking about the incidence of the deformity on the Nordic stocks. In explanation of the sex incidence, it is suggested that an important factor is the lesser obliquity or nearer approach to vertical of the wall of the female pelvis; but there is no precise evidence that such a difference between the male and female pelvis exists in infancy, or, if it does, that it is sufficient to determine a greater incidence of luxation in the female. If developmental aberration is held responsible it still remains to be discovered why the female sex is so preponderantly affected.

Nearly a century has elapsed since Pravaz first claimed to have cured a case of congenital dislocation by prolonged extension and manipulation. At that time, although a commission of the Academy of Medicine vouched for the cure such was [illegible] of opinion that the well-known orthopaedic surgeon Bonnier emphatically dissented, declaring that no case of congenital dislocation of the hip had been or ever could be cured. Later Pravaz claimed to have cured a number of cases, but after his death the treatment fell into disuse and interest in the subject waned until Paeci rediscovered some of the principles underlying Pravaz's method, and these were adopted and further elaborated by Adolf Lorenz. Until Roentgen's discovery in 1895 the diagnosis of congenital dislocation in young children was necessarily uncertain, and this meant that those very cases were liable to be missed which offered the best hope of cure. Coxa vara and luxation have been mistaken for each other by first-rate authorities, and the diagnosis has only been made certain by means of *x* rays. The first great advance in treatment was made by Hoffa of Würzburg, who had treated eight cases by open operation before the publication in 1891 of his well-known book on orthopaedic surgery. In at least one of these cases the treatment was very successful, and on these grounds we would extend Dr Galloway's 'barely thirty years since this disability was generally recognized as having been emancipated from the list of affections regarded as incurable' to over forty years. Hoffa clearly showed the way to anatomical correction by open operation, which involved excavation of the acetabulum and practically reconstruction of the joint. But the operation was severe, and not all the results were favourable, so that when Lorenz made his triumphal tour of the American clinics reducing dislocations of the hip by means of manipulation wherever he went, surgeons were carried away by his enthusiasm, and the operative method of Hoffa suffered undue depreciation and neglect. It soon became evident however that even treatment by manipulation was not infallible. In a formidable percentage of cases it appeared that the method had done irreparable damage, in not all the others had it succeeded in bringing about a cure. Only some of the defects were to be attributed to manipulation, by selection of cases and the use of gentler and more gradual methods better results were secured, and *open operation* was reserved as the final resort for obstinate and older cases.

Not all surgeons were content with this compromise, and it must be admitted that the advocates of arthrotomy had the best of the argument on anatomical and pathological grounds. The difficulties created by the hour-glass constriction of the capsule and the shallow or negligible acetabulum can only be overcome with certainty by exposing the parts and removing all obstacles to anatomical correction, and it is probable that most surgeons would adopt that method if they could feel sure that the risks of failure and of inflicting damage were negligible. After all the disability attending untreated congenital hip luxation especially in unilateral cases is too small to justify any great risks on the part of the surgeon. In northern Italy and France where congenital dislocation is most prevalent and in Great Britain where it is comparatively rare manipulative treatment has been the rule. In the United States however Dr Sherman of San Francisco has for some years treated all cases by arthrotomy and is entirely satisfied with the results. Dr Galloway tells us that since 1904 he has followed Sherman's example and in his opening paper he gives some account of the works by which he justifies the faith that is in him.

LONDON WATER

MUCH of the water supply of London comes on rain-laden clouds from the Atlantic The rain falls abundantly on the hills which dominate the watershed of the Thames Above and below ground it flows then as brooks and rivers or through vast underground lakes towards the sea It encounters on its journey thousands of contaminations, and comes at last to the Metropolitan Water Board robbed of its pristine purity It is then lured back by natural and artificial means into the realms of safety In phrases like these Sir Alexander Houston is wont to embellish and lend colour to the subject of water supply with the express object of quickening interest, for he believes that such a quickening of interest is one of the surest ways to create and maintain a feeling of responsibility Pursuing this policy, his twenty-fourth report,[1] covering the year 1929, contains an attractive and picturesque description, with photographs, of the service reservoirs of the metropolis, which balance or equalize consumption, and maintain supply when great mains burst or disastrous fires occur Usually situated at high levels and set like outposts to guard the central stronghold, they act as the sentinels over the water of London The reader is conveyed from reservoir to reservoir under the author's genial guidance, and for parts of the way in the improving or lively company of Keats, Shakespeare, Tom Hood, and Don Juan He is also invited to "come down to Kew in lilac time," is told where he can procure a hedgehog, and is entertained with a reflection on eels He is further regaled with a hypothesis that the collapse of the money market in Wall Street in the autumn of last year was due to the chlorination of New York water On this theory (with which the author of the report is not to be held as concurring) the non-sporing bacteria in water normally produce a state of psychological equilibrium which is antagonistic to speculation When the non-sporers are killed by chlorine the sporing germs survive alone and engender speculative fever! Lastly, for the benefit of the householder, there are useful hints on how to avoid burst pipes in frosty weather

In previous reports the claim had been made that since May, 1916, when the chlorination of part of London water began, about two million consumers had been supplied with chlorinated water without complaint of the presence of the tastes to which chlorine sometimes gives rise In 1929 the West Middlesex water provided the first exception The taste was traced to the reaction of chlorine with derivatives from a tarry paint with which the filtered water well at Barnes had been coated The careful examination of the pre-filtration waters—that is to say, the stored water in reservoirs—was continued as in previous years Raw Thames water was found to contain *B coli* in 0 1 c cm or less in 57 7 per cent of samples, while Chelsea stored water showed *B coli* in 100 c cm in 57 6 per cent of samples—a thousandfold improvement on the raw water The Barn Elms experiments were also continued, double filtration being employed, first rapidly through primary filters, then less rapidly through secondary filters, with no coagulant in either case The result has been a final product practically as good as that obtained by normal slow sand filtration, with comparative freedom from algal troubles and a considerably greater output of water per acre of filtration area At the Walton works, where the Barn Elms method is employed, similar results were achieved

In the course of an investigation into the occurrence of *B. typhosus* in raw Thames water some thirty samples, each of 500 c cm , were submitted to examination, and of these two gave a positive reaction Of some thirty controls, also of 500 c cm , inoculated with from 6 to 60 typhoid bacilli, or 25 on the average, all but 3 were found positive, the number of typhoid colonies isolated ranging from 1 to 22, with an average of 8 Collation of the two series suggests at least a comparative infrequency of *B typhosus* in the natural raw water The medium used was Wilson and Blair's glucose bismuth sulphite iron medium On a day in August the consumers of water from the Surbiton (Lambeth) works complained of an unpleasant taste and odour The water in the reservoir concerned was sweet, and the mischief was traced to a main which contained fresh-water mussels and sponges and masses of oscillaria Reference is made to the work of Adams, who has ascertained that certain leaves and twigs are capable of giving rise to the chlor-phenol, by product or iodoform taste in chlorinated water The plants implicated are willows and poplars and the meadow sweet (*Spiraea ulmaria*), and their reacting constituents are salicylic aldehyde, salicylic alcohol, and in less degree salicylic acid It appears that salicin, methyl salicylate, and acetyl salicylic acid are not taste-producing Reference is made also to the activated charcoal filters which have been employed in Germany and the United States to remove tastes from chlorinated waters

In 1929 the number of routine water samples examined in the laboratories of the Metropolitan Water Board was 15,694 Of these examinations, 4,433 were chemical and 11,261 bacteriological *B coli* was absent from 100 c cm of Thames-derived water as delivered to consumers in 72 9 per cent of samples For the Kent wells the corresponding figure was 98 6 per cent , for the Eastern and New River district wells 93 5 per cent In addition to the routine examinations some 4,000 samples were examined for *special purposes* These numbers convey an impression of the rigid scrutiny of the water supply of London

THE WINNIPEG MEETING

IN our present issue at page 427 we begin publication of reports of the proceedings in the Scientific Sections of the Winnipeg Annual Meeting, which ended on August 29th It is hoped that these summaries will give an idea of the ground covered at each session The papers introducing the debates will be printed in full in our columns during the autumn and winter We expect to publish also in early issues of the *Journal* some account of the social events which have formed such a prominent and enjoyable feature of the British Medical Association's visit to Canada The principal function on the afternoon of Thursday, August 28th, was a special convocation of the University of Manitoba, held in the Winnipeg Winter Club, for the conferment of honorary degrees Archbishop Matheson, Chancellor of the University, presided Those who received the degree of LL D were Professor W Harvey Smith, President of the British Medical Association, and Professor A H Burgess, Past-President, Dr S W Prowse, Dean of the Faculty of Medicine, Manitoba University, Lord Dawson of Penn, President of the Section of Medicine, Lord Moynihan of Leeds, President of the Section of Surgery, Sir StClair Thomson, President of the Section of Laryngology, Sir Farquhar Buzzard, President of the Section of Neurology, Sir James W Barrett, of Melbourne, Professor W E

Dixon, of Cambridge, Mr N Bishop Harman, President of the Section of Ophthalmology, and Treasurer of the Association, and the Medical Secretary, Dr Alfred Cox The new President and the nine guests to whom this honour was accorded were introduced to the Chancellor by Dr Prowse who was himself introduced by the Hon E W Montgomery M D, Minister of Health and Public Welfare for Manitoba At the annual dinner held on the Thursday evening in the Hudson Bay Dining Room there was a very large attendance the company numbering 1,500 The toast of "The Empire" was proposed by Lord Mowmhan, and responded to by Dr W W White, Mayor of St John, New Brunswick Dr W W Chipman, of McGill University proposed the toast of "Prosperity to the British Medical Association," and Dr H B Brackenbury in reply thanked the citizens of Winnipeg and the members of the Canadian Medical Association for their hospitality In his response to the health of the guests, submitted by Sir StClair Thomson Dr William Gerry Morgan, President of the American Medical Association, said that better results in the teaching of medical science might be secured if there were a yearly interchange of representatives between the leading schools of Great Britain and America The toast of 'The Ladies" (which appeared on a B M A dinner programme for the first time) was proposed by Professor Burgess, and Mrs Harvey Smith acknowledged the compliment in a few graceful words During the evening Dr Cox was presented with a bronze statuette of a buffalo, in appreciation of his work in preparing for the meeting in Winnipeg This presentation was made by Dr J D Adamson, honorary general local secretary, to whom so much of the great success of the meeting is due

GASTRIC TISSUE IN THE TREATMENT OF PERNICIOUS ANAEMIA.

INVESTIGATIONS carried out by Sturgis, Isaacs, and Sharp[1] in America, and by Wilkinson and Renshaw[2] in this country, have tended to show that the mucous membrane and the muscular layer of hog's stomach are effective in the treatment of pernicious anaemia According to Wilkinson the results obtained from the administration of this diet are slightly better than those following liver therapy, the condition of the patients improving more rapidly, and various symptoms, particularly glossitis and paraesthesias, showing a more ready response Castle and Locke,[4] by feeding patients suffering from pernicious anaemia with beef that had been predigested in a normal stomach, had previously obtained improvement similar to that which usually follows liver therapy, and their observations had suggested the possibility that pernicious anaemia might be due to a failure of the gastric juice to elaborate some principle normally formed in healthy persons from the proteins of food "The experiments," said Castle, 'are consistent with the hypothesis that the intimate nature of this reaction is a digestion of the protein made by an enzyme working in an acid medium If this work can be taken at its face value, an analogy is established to the condition present in diabetes In diabetes the pancreas is the organ at fault, and the physiological defect resides in the internal metabolism of carbohydrates In Addisonian pernicious anaemia the defect lies in the external manipulation of the protein, and the stomach is the organ that is deficient" Further data relevant to this hypothesis are recorded by H M Conner in the *Proceedings of the Staff Meetings of the Mayo Clinic* for July 23rd (p 205) Conner administered gastric tissue in various forms—namely, as raw whole stomach, raw mucous membrane of entire stomach, raw whole pylorus, raw whole fundus, raw whole stomach muscle, desiccated stomach or various combinations of these—to 60 patients, 45 of whom were studied in hospital, and as the results from the use of the various proportions and preparations were similar they may for convenience be considered together The proportion of reticulated erythrocytes rose to 65 8 per cent in one case, 40 per cent in another, between 30 and 40 per cent in six cases, between 20 and 30 per cent in five, and between 10 and 20 per cent in thirteen The patient in whom the increase had reached the highest figure received daily half a pound of the entire thickness of the wall of the pylorus only The greatest increase in the proportion of reticulated erythrocytes and the number of mature erythrocytes occurred in cases in which before treatment the erythrocyte count was less than 2 000 000 in each cubic millimetre in the group of patients having a blood count of less than 1,000 000 in each cubic millimetre the proportion of reticulated erythrocytes increased to an average of 24 3 per cent in under nine days, and the number of erythrocytes to over 2 000,000, in the group having a count between 1 000,000 and 2,000,000 the proportion of reticulated erythrocytes increased to an average of 22 8 per cent in nine and a half days, and the number of erythrocytes to nearly 3,000,000 The leucocyte count in the whole series increased from an average of 4,873 to 6,464, and the platelet count from 101,540 to 118,080 in each cubic millimetre of blood The effect on the general symptoms was equally good, but not enough time has elapsed to estimate the effect of the treatment on the neurological condition In many cases, though not in all, the numbness and tingling were lessened, but so far incoordination has responded less definitely to treatment Conner concludes that the effect of the treatment on the reticulated erythrocytes, on the mature erythrocytes, and on the general and neurological symptoms in cases of pernicious anaemia is similar to that obtained by means of liver therapy

COSMETICS

HAS any British dermatologist ever yet written a volume on cosmetics? We do not remember one That there is a demand for information on the subject from the British medical public is undoubted, for translations of the writings of our Continental colleagues (who apparently are not so frightened of being labelled 'beauty doctors") command a ready sale and it is rumoured that our native publishers would welcome a book on the subject by a British authority, if the scruples of those qualified to supply this long-felt want could be overcome Since these things are so, medical practitioners who desire instruction in the cosmetic art are compelled to resort to translations of Max Joseph, Saalfeld etc, but these authors are now liable to be superseded by Kromayer, whose little volume on the cosmetic treatment of skin complaints has lately been translated from the second German edition for the benefit of the English speaking world Professor Kromayer has long been known to the medical profession as inventor of the Kromayer lamp, an instrument generally acknowledged to be of great value in the treatment of various deep-seated inflammations of the skin notably lupus vulgaris and acne But he has also invented a new system of surgery for cosmetic purposes which is not so well known (at all events in this country) The treatment demands the employment of a dental engine for the actuation of various cylindrical knives, burrs, rasps, drills, etc. The cylindrical knives or punches are of various sizes and, applied vertically, remove a round disc or column of tissue varying in diameter from 0 8 mm to 10 mm or more according to the size of the knife, and

[1] *The Cosmetic Treatment of Skin Complaints* By Professor E Kromayer London Milford, Oxford University Press 1930 6s 6d

Kromayer claims that by the employment of these instruments scarring is greatly diminished He uses them for many different purposes Among other things, he treats boils by punching out of them a cylinder of tissue, which he makes sufficiently large to remove the whole of the necrotic tissue This may require the employment of a punch as much as a whole centimetre in diameter He claims rapid healing in the majority of cases, but admits that it is impossible to be certain of a cure owing to the occasional reappearance of the infective process This indeed resembles the experience of everyone who treats boils Whatever the method adopted they usually do well, but sometimes they do not The punch is also used to open the indolent abscesses of acne, and the comedo is scooped out with drills rather like a dentist's drill Since, however, "the prick is not altogether imperceptible" many patients jib at this procedure Kromayer even employs the cylindrical knife for the excision of superfluous hairs in certain circumstances, but he does not despise electrolysis Still another opportunity for the employment of the cylindrical knife is in the removal of tattoo marks He punches the tattooed area all over and removes the punched-out pillars of skin with forceps and scissors Naturally most cases need more than one operation, but it is claimed that the scar left is hardly visible There is no doubt that Professor Kromayer is a man of great inventive ability and ingenuity, and these special technical methods employed by him deserve attention although in other hands they might not prove so satisfactory Apart from these matters the contents of his book consist of an account of general dermatological therapy of such diseases as affect the visible portions of the cutaneous surface It is evident that the restoration to normality of any of these parts when afflicted by some pathological condition must always have a "cosmetic" value, whether it be formally labelled "cosmetic" or not To postulate the possession of a special "cosmetic" art is to attempt a meretricious appeal to human credulity and feminine vanity Perhaps, after all, the stiff-necked British dermatologist is right when he refuses to attach the label "cosmetic" to his essays on dermatological therapeutics

INTERNATIONAL UNION AGAINST TUBERCULOSIS

THE seventh conference of the International Union was opened in the great hall of the University at Oslo on August 13th, in the presence of the King and Queen of Norway The gathering was attended by between six and seven hundred delegates from all the European and a great number of other nations The trend of questions on the agenda commenced with a discussion of the merits of B C G vaccination methods, appropriately introduced by Professor Calmette Some of the interest that centred round this subject was naturally due to the recent catastrophe at Lübeck, but as this matter is still *sub judice* all reference to it at the conference was banned Professor Calmette gave a careful and reasoned summary of the points on which he advocates the use of his strain of attenuated bacilli as a complete means of protection against tuberculosis, maintaining that the culture, given within ten days of birth, would, by passing through the immature cells of the intestinal wall, permeate the lymphatic system He claimed that all experience had shown that the death rate among children so treated was less than that among unvaccinated infants in contact with open cases of tuberculosis Restrained support was given for the method by Neufeld of Berlin and W H Park (New York), Save (Barcelona) and Heymans van den Berg (Amsterdam) commended it from clinical as well as laboratory experience In the course of general discussion B C G came in for some criticism, but on the whole there appeared to be a preponderance of views in Calmette's favour The second subject on the programme, "Thoracoplasty in the treatment of pulmonary tuberculosis," gave less room for acute controversy, all divergence being merely on details of technique Professor Bull of Oslo, describing his own experience and that of his Norwegian colleagues, said that he limited the choice of his cases to those in which more conservative treatment had failed and in which pneumothorax could not be induced, and claimed that nearly half of the chronic cases insusceptible to other therapeutics could be cured by this method Professor Bull favoured the two-stage operation, but this view was not shared by Sauerbruch (Berlin) or by Graysen (Denmark), except in special cases Morriston Davies (Ruthin) recommended greater elasticity of method in planning the operation and as regards the length of rib resected Throughout the debate there was a feeling of hopefulness and a conviction that this procedure had passed the experimental stage Dealing with the problem of teaching tuberculosis to medical students and doctors, Professor His of Berlin read a very exhaustive paper based on a questionary he had sent to most of the world's universities He maintained that this subject must not be divorced from general medicine The instruction of undergraduates was fairly well organized, but post-graduate courses required more development Sir Robert Philip gave his experience as a teacher of the subject since 1889, and hoped that attention would be concentrated upon the disease more as a general clinical problem and less as an exclusively lung disease The Italian delegate (Morelli) delivered a full description of the impressive Mussolini Institute which is building at Rome and will be devoted largely to tuberculosis Many members *en route* for Oslo took the opportunity of visiting Hamburg, where, under the inspiration of Professor Brauer, a varied programme had been arranged by German tuberculosis societies The newer methods of nutrition therapy were discussed, and the members had the privilege of examining pathological specimens taken from the cases at Lübeck and of hearing Professor Schürmann of Berlin describe the lesions in this large-scale catastrophic experience From the conference delegates carried away an impression of meetings superbly organized both on the scientific and on the social side, and of generous Norwegian hospitality It was impossible not to feel that in most countries a great amount of energy was being devoted to research into the problems of tuberculosis

MILTON'S BLINDNESS

THE cause of Milton's blindness is one of those fascinating ophthalmological problems which in all probability will never be solved Briefly, the most favoured diseases are glaucoma, retinal detachment, and choroido-retinal degeneration leading to optic atrophy, possibly due to congenital syphilis, while Mutschmann, a *littérateur* and not a medical man, argues that Milton was an albino, though he accepts Hirschberg's dictum that the blindness was due to glaucoma In the July number of the *British Journal of Ophthalmology* Mr Arnold Sorsby reviews the evidence at length, and sums up in favour of retinal detachment His paper is a very able study of the question, and those who are interested will be well repaid by its perusal The evidence comes mainly from autobiographical details by Milton in the sonnet to his blindness, in the sonnet addressed to his pupil Cyriack Skynner, in *Paradise Lost*, in the *Defensio Secunda*, and in his letter to Philaras Contemporary portraits of Milton are few in number, and engravings unreliable. Two of the pre-ophthalmoscopic writers on ophthalmology mention Milton's case, Sir William Lawrence holding that the blindness was due to "suffusion," while William Mackenzie thought it due to "amaurosis from congestion or inflammation of the optic nerve secondary to chronic disease of the digestive organs" Glaucoma, as a cause, was first proposed in 1879, when Stern, in his *Life of*

Milton, wrote that he had consulted a distinguished ophthalmologist," who stated that "some of the features tended to a diagnosis of glaucoma, though others were against such a view" Hirschberg and Shastid follow this statement without giving any reasons The source is from the letter to Pluiaras, where Milton states that if he "looked at a lit candle, a kind of iris seemed to snatch it" from him Milton's sight appears to have begun to fail in the outer field of the left eye at the age of 35 years, and he was quite blind by the age of 43 years Dufour of Lausanne, in 1909, argued in favour of retinal detachment, complicating myopia Saurat and Cabannes, in 1924, suggested that Milton suffered from congenital syphilis The Skynner sonnet shows that when Milton had been blind for three years his eyes looked normal, there had been no degeneration such as cataract, obviously to mar their appearance The sole evidence in favour of glaucoma is the "iris," and it is a well-known fact that a halo round a light is not always due to glaucoma, while the description of micropsia, metamorphopsia, the "copious light glittering from shut eyes," and the loss of field in the left side of the left eye are far more suggestive of detachment of the retina than of chronic glaucoma Sorsby sees no reason to take the suggestion of congenital syphilis seriously, and we think that all impartial readers will agree with him A parallel might be drawn with regard to the case of Samuel Pepys and his failure of eyesight Though Pepys never went blind, he had to discontinue his diary at an early age, and was unable to use his eyes for work ever afterwards Milton was fortunate in having the power to compose his splendid poetry to offset his physical handicap On the whole, the nature of Milton's blindness is a problem which, on the evidence available, must be considered as insusceptible of *definite proof, and therefore to be relegated to* the problems proposed by Barham in the *Ingoldsby Legends*

"Inquire if Orpheus first produced the waltz,
How gas-lights differ from the Delphic vapour
Whether Hippocrates gave Glauber s Salts
And what the Romans wrote on, ere they d paper"

MEDICAL INCUNABULA.

LIEUT.-COLONEL F H. GARRISON, the great authority on medical history, whose contributions to the *Bulletin of the New York Academy of Medicine* give such delightful instruction, has contributed to the June number of that monthly periodical what is really a guide to the study of incunabula, or the books, pamphlets, and broadsheets printed before 1501, though its value is hardly indicated by the modesty of its title, "Progress in the Cataloguing of Medical Incunabula" Beginning with a history of printing and a reference to the troubled activities of Johann Gutenberg in this "black art," it mentions other early printers who did so much to render possible the revival of learning, and goes on to describe the lives of the chief cataloguers of incunabula The first to do so on a large scale was Michel Maittaire (1668-1747), who had the privilege of being at Westminster under that vigorous wielder of the cane, Dr Busby, although he was kept at the study of Greek and Latin some years longer than usual, he was called "puzzle headed" by Samuel Johnson, and apparently from the character of his entries in the catalogue not without some reason Henry Bradshaw (1831-86) of Cambridge was the first to define clearly the modern methods and ideals of cataloguing incunabula—namely, to arrange them under countries, towns, and presses, and to advocate the serious study of palaeotypography, which, however, was not established until the beginning of this century by Robert G C Proctor (1868-1903) of Oxford and the British Museum, and by Konrad Haebler of the Royal Library of Berlin It was W A Copinger (1847-1910) of Manchester who first conceived "the genial idea" of describing the peculiarities of catalogued incunabula in the vernacular Thumb-nail sketches of others eminent in this connexion, especially Karl Sudhoff follow, and attention is drawn to the forthcoming catalogue by A C Klebs of more than 3,000 incunabula of medical and biological importance America is rich in these medical works The College of Physicians of Philadelphia has 373, and Lieut Colonel Garrison attaches to his interesting article a 'check list' of the 446 incunabula in the Army Medical Library, Washington, D C

POSSIBILITY OF A VITAL REACTION IN THE DENTAL ENAMEL

THE possibility of an organic content, and hence of a vital reaction, in human enamel has long exercised the minds of dentists, and the late Mr Howard Mummery thought he had found evidence of a sclerotic reaction to injury in human enamel In a communication on the histological evidences of the organic content and reactions of marsupial enamel, with a note on human enamel,[1] which was submitted to the Royal Society by Professor William Bullock, Mr Evelyn Sprawson claims to show that a vital reaction can be demonstrated in the tubular enamel of marsupials Allowing for structural and calcific differences, he claims to have found similar reactions in human enamel, and hence argues "that many of the conclusions concerning marsupial enamel must also be true of human enamel" We cannot say that the author presents a very convincing case, and in some of the illustrations we cannot see all that the legends claim—perhaps on account of the difficulty of photomicrography The investigation is one involving unusual difficulty, both in the preparation and interpretation of the sections, and yet it is of absorbing interest Every dentist will hope that Mr Sprawson will continue his researches

ANNUAL MEETING OF THE MEDICAL ASSOCIATION OF SOUTH AFRICA (B M.A.)

THE third scientific annual meeting of the Medical Association of South Africa was held at Durban from July 21st to 26th The Governor-General, the Earl of Athlone, attended the opening session on July 21st, and spoke *appreciatively of the high idealism maintained by the* medical profession He mentioned the local difficulty of providing still more effective medical and nursing services for the six million Bantu inhabitants of the country, and emphasized also the importance of establishing and maintaining centres throughout South Africa where radium *therapy could be practised The new president of the* Association, Dr M G Pearson, delivered an address on 'Tradition in medicine", this is published in the *Journal of the Medical Association of South Africa (British Medical Association)* of August 9th In that issue also will be found an interesting summary of the scientific and social proceedings of the annual meeting, and also a paper by Dr A D Pringle on pulmonary tuberculosis in South Africa which was read in the Section of Medicine Editorial reference is made to the addresses by the Governor General and Dr M G Pearson, it is pointed out that the problem of co-ordinating professional needs with the obligations of loyalty to a noble tradition and to the public welfare calls for faithful co-operation a high conception of duty and the ability to ignore unessential details.

THE KING has appointed Dr W Norwood East to be one of His Majesty's Commissioners of Prisons and a Director of Convict Prisons

WE regret to announce the death, at the age of 82, of Dr Michael Beverley, who was for fifty years associated with the work of the Norfolk and Norwich Hospital

[1] *Proceedings of the Royal Society* B, vol IX 1930

THE BRITISH ASSOCIATION.

ANNUAL MEETING IN BRISTOL

THE British Association for the Advancement of Science, which held its annual meeting this year in Bristol from September 3rd to 10th, was founded in 1831 at York by a small body of enthusiasts, and it has thus now reached the hundredth year of its existence. The centenary celebrations will be held next year in London.

At the opening general meeting in the Colston Hall the Lord Mayor of Bristol and the Vice-Chancellor of the University extended an official welcome. Sir Thomas Holland, Principal of the University of Edinburgh, who is the retiring president of the association, thanked the city and University for their cordial reception. He mentioned that the council had sanctioned an appeal for a fund to provide for the special expenses of the centenary meeting next year, and also for the more adequate endowment of the association. It was hoped that a sum of £40,000 might be raised, part of which was required in connexion with Down House, and part to facilitate a wider choice of subsequent meetings, as well as to stabilize the grants made in aid of research.

Presidential Address

Professor F. O. Bower was then inducted by Sir Thomas Holland into the presidential chair, and delivered an address on size and form in plants. He remarked that Down House had now been restored and opened as a shrine for those who treasured the memory of Darwin, one of the events which indicated the close of a famous epoch. Morphology, or the study of form, had been described by Darwin as one of the most interesting departments of natural history, almost, indeed, its very soul. It was therefore fitting that a botanist whose work had dealt specially with form in plants should discuss this year certain morphological questions which presented themselves in the eighth decade since the publication of the *Origin of Species*. After alluding briefly to the flagellata as combining animal and vegetable characters, the president discussed the normal development of the multicellular plants, with special reference in this connexion to the influence of size and to the part played by the "presentation-surfaces" through which physiological interchanges were effected. The relation of form to size seemed to be very general and suggested the existence of a "size-factor," which had a marked influence on the determination of form. The operation of this factor could not be evaded, under natural or experimental conditions though size might vary under altered conditions of nutrition. Professor Bower concluded his address with illustrations of the valuable services rendered to mankind by botanical experts, and mentioned the urgent need of a greater supply of botanical specialists to work as investigators and advisers, both at home and abroad. He recalled the prophecy of Sir William Crookes in 1898, when the British Association last met in Bristol, that in 1931 there would be a world-wide wheat shortage unless some new agricultural factors came into existence, one then mentioned being an advance in the artificial production of nitrates. Professor Bower remarked that this forecast of new discoveries had been fully realized, and artificial fertilizers were now available in mass. The production of synthetic nitrogen had become a commercial proposition, and the improvement of wheat strains by selective breeding along Mendelian lines had solved the crucial question of food supply, both achievements owed their origin to advances in pure science.

Synthetic Activities of the Cell

Professor H. S. Raper, president of the Section of Physiology, delivered an address on the synthetic activities of the cell, a discussion followed. He opened by remarking that the old-standing distinction between anabolic and katabolic chemical transformations must not be taken to imply independence, for example, the synthesis of one substance might involve the concurrent breaking down of another. Physiologists had been more successful in elucidating the phenomena of katabolism, but the anabolic cellular processes were at least as fascinating as the synthetic achievements of chemistry, being manifestations of the creative instinct. Although Wohler discovered rather more than a century ago that urea could be prepared from ammonium cyanate, no further step followed until Kekulé, thirty years later, enunciated the historic hypothesis of the tetravalency of carbon and the mode of linking of the carbon atoms, thus opening up the way to discover the structure of organic compounds produced by living organisms, a matter of prime importance to the physiologist. The animal cell offered a simpler field for study than the vegetable cell, because the choice of raw materials for synthetic activities was limited, it comprised about twenty amino-acids, two purine bases, three pyrimidine bases, three hexoses, glycerol, and higher fatty acids. The synthesis of cholesterol, the bile acids, and the purine bases was still undetermined, though the amino-acid histidine was possibly to be considered their precursor, for structural reasons, but the case of adrenaline was simpler, for it might be derived from either of the two amino-acids phenylalanine or tyrosine by successive oxidation, methylation of the amino group, and loss of carbon dioxide. Details were then given by Professor Raper of the way in which these processes might be brought about, and in the comparable case of thyroxine. The president then passed to the consideration of the production of fat from carbohydrates, mention being made of the possibility of the fatty acids being built up from a degradation product of glucose, of the formation of fatty acids in micro-organisms, and of the mechanisms involved in alcoholic fermentation and the chemical changes in muscular contraction. Physical conditions were also probably of importance in this connexion.

The syntheses of glycogen and the proteins were dealt with in considerable detail, it being pointed out that something more than the mere reversal of enzyme action was concerned. The facts seemed to indicate that only the living cell could bring about such synthesis, and that the precursors of glycogen, or bodies derived from them, must at some time have formed an integral part of the living cell structure. As regards protein synthesis it seemed clear that although the mechanism of joining up amino-acids might be the same in all cells, yet there must be arrangements in the cell which ensured that the protein molecule produced by a particular type of cell would always be built up in a distinctive and probably unvarying pattern. It might be that the cell nucleus was the seat of such synthetic activities, the protoplasm being relatively non-living, but serving possibly as a convenient storehouse for reserve materials needed in the synthetic process, as well as a protective layer between the nucleus and the outside world. The filterable viruses might represent elementary forms of cellular life, and their chemical characters resemble those found in the cell nucleus. Until it was possible to analyse and understand cell behaviour the reactions of the whole organism could not be fully explained. The synthetic breakfast table was, however, likely to remain a myth for from both the chemical and economic points of view there seemed little likelihood of discoveries being made which would make possible the synthesis of the main food stuffs—namely, proteins, carbohydrates, and fats.

The Psychology of Early Childhood

Professor C. W. Valentine, president of the Section of Psychology, delivered an address on the foundations of child psychology, with special reference to their bearing on some problems of general psychology. He insisted that the most reliable evidence as to what was genuinely innate in human nature was to be found in the study of infancy. Instinctive impulses were then seen in their crudest form, and the elementary cognitive processes might be watched evolving from their origins. Moreover, the study of infant psychology tended to correct the unduly prevalent tendency to interpret later childhood too much on the lines of adult experience. Psycho-analysts had asserted that the first four or five years of life were the most important as regards the fixing of character, but, while this was largely true, it was unnecessary to make extreme statements about the absolute fixation of character by the age of 5 or 6. The assertion of another school of thought

that there were few innate instincts, and that any infant treated early enough could be "conditioned" into almost any type of character, could be combated by adducing evidence from early childhood, but it was clear that at the age of 1 or 2 years the infant was particularly sensitive to its environment. Binet's scheme of testing intelligence from the age of 3 upwards had been supplemented by the work of Dr Arnold Gesell, standardized tests being now available for infants as young as 4 to 9 months, and affording prognostic facilities as regards the later development of intelligence. Details were given of the employment of Gesell's tests, with especial reference to the development of speech.

Professor Valentine considered next the problems associated with the early appearance of "fear" and "imitation," and passed to the discussion of theories of "laughter," which he thought had erred in being far too simple. Observation of his own son led him to define ten causes of laughter, the first being the getting or anticipation of food at the age of 39 days. At 10 weeks there was a laughing response to laughter by others and also to tickling, at twelve weeks to the sight of a bright or pleasing object. Then followed in order such causes as a simple shock or surprise, repetition of a stimulus, the unfamiliar or unusual, mere recognition (at 8 months, but doubtful), successful accomplishment of some activity, such as standing alone (8 to 12 months), and the sight of the mild discomfiture of another (first noted in the seventeenth month, but possibly to be dated considerably earlier).

The speaker believed that the study of early child psychology would throw a flood of light on to the problem of the fundamental nature of thought processes, and he gave details in this connexion, including the elucidation of the question whether thought could take place without words. Explanation was similarly forthcoming of the loquacity of some adults, and the recognition in early childhood of the existence of such relations as attribution, agency, causation and likeness, which were apprehended by about the age of 3 when the beginnings of induction and deduction were also manifest. All the errors classified as "childish" could frequently be detected in adult thought. The various types of thought process occurred very sporadically in the early years of life, careful daily observation was therefore essential. More systematic and intensive study of this relatively neglected field of child psychology would result in a rich harvest of contributions to general psychology.

(To be continued)

PREVENTION OF STILLBIRTH AND INFANT MORTALITY

THE LEAGUE OF NATIONS INQUIRY

THE Health Committee of the League of Nations felt that an international inquiry into the causes of infant deaths might have considerable value when it undertook the task in 1926, the memorandum* of its results which has been published this year justifies this opinion. Investigations have now been carried out in Austria, France, Germany, Great Britain, Italy, the Netherlands, and Norway and the general plan has been to select certain districts and pursue uniform methods of inquiry in each. The experts appointed by the committee worked in co-operation with the medical practitioners and paediatricians of the districts under investigation, and, upon the notification of deaths by the competent authorities, information was sought from the family doctor, the midwife, members of the staff of maternity and infant welfare centres, the visiting nurse, officials at the registrar's office, and from persons acquainted with the child's environment, such as clergymen and school teachers. The home of the child was also visited, the aim being to investigate the case from the medical, social and hygienic standpoints. The individual inquiry form used covered the housing and social conditions of the family, the nature of any work performed by the mother during pregnancy, the feeding of the child, and a history of its last illness, and of the post mortem findings where possible.

Memorandum Relating to the Inquiries into the Causes and Prevention of Stillbirths and Mortality during the First Year of Life. (Williams and Norgate Ltd. 3s. 3d.)

Medical Causes of Death

An analysis of the medical causes of death showed that these varied in different districts, those in which the infant mortality was low—namely, 3·5 to 4·9 per cent.—having a high proportion of cases of respiratory disease, few cases of digestive disturbances, and only a small incidence of acute specific infections. Deaths before, during, and immediately following parturition constitute almost two-thirds of the infant mortality not only in these districts, but in those where the mortality rate was moderate and high. Digestive disturbances and specific infections play a more serious part in districts where the infant mortality rates reached 5 to 6·9 per cent., respiratory diseases had much the same incidence as in districts with a low mortality, but their relative importance was less owing to the larger number of deaths from other causes. Districts where infant mortality reached a high rate—namely, between 7 and 9·9 per cent.—were characterized by an increase in the prevalence of digestive disturbances and infectious diseases, and an increase in respiratory diseases, while syphilis and tuberculosis tended to become more important than in the preceding groups of districts. Finally, digestive disturbances were responsible for a large number of deaths in the districts where the infant mortality rates reached figures above 10 per cent., and respiratory and infectious diseases also bulked large, deaths during the obstetrical period attained higher figures in some of these districts than in any of the preceding groups.

Influence of Social Conditions

Considering these statistics in relation to the housing and social conditions found in the various groups the committee concludes that where general conditions are favourable the greater number of deaths occur during the obstetrical period and in connexion with respiratory diseases, while in districts where the conditions are unsatisfactory the relative importance of these two causes is less marked owing to the higher proportion of deaths due to infectious disease and digestive disturbances. It also finds that stillbirth, congenital malformations and obstetrical trauma are relatively more important causes of deaths among families of good social status the higher proportion of cases of obstetrical trauma suggests that the more frequent use of forceps among families in better social conditions may be partly responsible.

Deaths from unknown causes played an unexpectedly large part in all the districts investigated and usually occurred during the first week of the infant's life. The stillbirth rate varies little in the different districts but tends to be relatively more frequent in the higher social classes and to diminish as the scale is descended. As might be expected, unfavourable housing conditions appear to have less effect on pre-natal and neo-natal causes of death than on post-natal causes.

Influence of Multiparity

A most striking conclusion is reached in relation to the position of the child in the family: the mortality rate is usually lowest among second and third children, and gradually increases with the order of births; the mortality of first-born children is higher than for second children but lower than the average. The first-born child is of course exposed to greater danger as a result of malpresentations and obstetrical traumatisms. No definite statistical evidence was secured to show that ante-natal supervision had a marked effect in reducing infant mortality, but it was extremely difficult to determine how much supervision had been exercised in any individual case during pregnancy. It was fairly obvious however, from analysis of results that ante-natal supervision was inadequate in all the districts investigated and among all classes of persons.

Conflicting Social Factors

The point of interest which seems to emerge from the inquiry is the absence of any one distinctive factor in determining the infant mortality rate Bad housing and unfavourable economic conditions are by no means invariably disastrous in their effects In the districts where the mortality was very high the houses where conditions were good or moderate far outnumbered those in which they were bad, except in Vienna, District X, where there were 207 deaths under one year, and where 11 dwellings only were good, 85 moderate, and 111 bad Although the proportion of bad houses to good was higher in these districts than in those where the infant mortality was low, the discrepancy is not so decidedly marked as might have been expected Similarly, in the matter of ante-natal examination, though a larger number of women had received supervision in the districts with a low mortality, the difference in the numbers from those examined in the districts where the mortality was very high was not sufficient to make lack of such care appear to be the deciding factor A few figures may be quoted as an illustration In Oxfordshire, among fatal cases, 66 received ante-natal supervision, 25 did not, in Hedmark 44 were examined and 26 were not, while of 90 cases of stillbirth 21 had some supervision and 69 had none, in Oslo West there had been supervision in 14 cases of stillbirth and none in 5, while among deaths under one year there were 13 cases which received supervision and 8 which did not, in all these districts the infant mortality rate was low In districts with a very high mortality, such as Pays de Bray, 53 had come under supervision and 106 had not, while among cases of stillbirth the corresponding figures were 20 and 17 respectively, in Mecklenburg-Strelitz 13 cases of stillbirth were examined and 50 were not The mortality rate seems to depend in every case on an interaction of various factors, one of which may play a part in counteracting others Thus, favourable hygienic conditions may be set against poor housing and social conditions as in Oxfordshire, or well-organized infant welfare work may help to restrain the native stupidity of the parents in some districts Occasionally, as in Hedmark, nature triumphantly defies all the rules, and in spite of indifferent housing, and little ante-natal supervision or child welfare work, produces a low mortality rate In this case the result appears to depend on the prevalence of breast-feeding, and hygienic conditions which are described as "usually favourable"

The Committee's Recommendations

In its general conclusions the committee points out that, in districts where public health measures have been enforced and economic conditions are favourable, digestive disturbances and infectious diseases have almost disappeared as causes of infant deaths, while the rates for stillbirth and mortality during the first days of life are the same as in districts where the infant mortality is still high It recommends the establishment of more efficient ante-natal and welfare services in all districts, but though this should have a marked effect in reducing infant mortality, it admits that the causes of premature birth, stillbirth, and deaths during the first days of life are not as yet completely understood, and require further research on the part of obstetricians and paediatricians For the better supervision of the pregnant woman it advises, in addition to an increase in the number of clinics, a campaign against the employment of untrained women, and the cultivation of a better understanding on the part of the mother of the necessity for skilled supervision throughout pregnancy

As overwork on the part of the mother appears to have been responsible in some cases for the death of the foetus, the committee suggests an extension of legislation for the protection of pregnant women so as to allow sufficient rest before and after confinement This could be best effected, it considers, by an increase of financial benefit and the extension of health insurance with provision for dependants An increase in the accommodation in institutions and the provision of more maternity hospitals is recommended, with facilities for better obstetrical training of both physicians and midwives Special attention should be devoted to the care of infants during the first few hours of life, especially those who are premature or feeble The measures advised for the reduction of digestive disturbances include the encouragement of breast-feeding, the extension of infant welfare organization, and measures for the supervision and improvement of the milk supply General measures would include visiting by the public health nurse, education of the public by means of schools of hygiene, with courses open to all members of the community The provision of post-graduate courses for both doctors and midwives is especially urged, a suggestion also included in the projected scheme for a national maternity service Preventive measures against syphilis and tuberculosis should be used to the full, and the public should be taught how very easily a mild respiratory disease in an adult can give rise to a serious condition in an infant Although the recommendations of the committee embody no startling new suggestion, their application would cover a wide field, and would have the effect of co-ordinating and extending the present measures for the protection of infant life It is curious, however, that it includes no reference to an improved housing scheme among its suggestions.

Scotland.

Health of Glasgow in 1929

In a preface to his report, the medical officer of health, Dr A S M Macgregor, points out that the estimated population of Glasgow, 1,160,720, is a very tentative one, and he looks forward to the forthcoming census of 1931 to afford really detailed and accurate data concerning the movements and vital statistics of the population The report states that the birth rate during 1929 was 19 6 per 1,000—the lowest rate yet recorded for the city The rate varied from 28 8 in Mile-end ward to 6 2 in Kelvinside In the latter ward, with a birth rate lower than ever recorded in any ward, there was actually a decrease of almost eight for every thousand of the population The marriage rate for the city, of 8 5 per 1,000, was very similar to that of recent years The death rate of 15 3 per 1,000 compared unfavourably with those of the preceding four years The increase was entirely due to the high rate (25 2) during the first quarter, when pneumonia, influenza, and other respiratory diseases affected the city with great severity The problem of pneumonia is recognized as of supreme importance, for, as the report observes, the history of the city's health has become largely the history of its respiratory diseases A serious question is that of hospital accommodation for the victims of respiratory disease, the existing facilities being taxed beyond their capacity at a time, such as the month of January, 1929, when there was a combination of an epidemic of influenza with very trying weather conditions Dealing with tuberculosis, Dr Macgregor points out that the death rate from this disease is now one-quarter of what it was sixty years ago There is, however, one disquieting feature While there is a remarkable fall in the death rate from pulmonary tuberculosis at later ages, practically no impression is being made on that between the ages of 15 and 25 With regard to venereal disease, the report states that the number of new patients was slightly less than in 1928, but the aggregate attendances at the treatment centres were appreciably greater The difficulties of obtaining information about patients have made it impossible as yet to give a definite opinion with respect to the later results of treatment, or to utilize fully the experience of the clinics for the advancement of medical knowledge as to the incidence and consequences of these diseases A considerable part of the report is devoted to housing, and it is pointed out that, although the housing situation in general has improved greatly of recent years, overcrowding in one apartment houses has apparently diminished very little since the war The really important matter at the present time continues to be the provision of houses within the competence of the small wage earner The year registered still another step forward in the campaign for a purer atmosphere

New Aberdeen Professors

Appointments to two chairs in the University of Aberdeen are announced to take effect on September 30th. Dr James Ritchie, at present Keeper of the Natural History Department of the Royal Scottish Museum, Edinburgh, succeeds Sir Arthur Thomson as Regius professor of natural history, and Dr David Campbell, *M.C.*, Pollok Lecturer in pharmacology and therapeutics in the University of Glasgow, succeeds Professor C. R. Marshall in the Regius chair of materia medica. Dr. David Campbell was born in Ayrshire, and received his education at Ayr Academy and Glasgow University. After graduating M.A., B.Sc., he obtained the degrees of M.B., Ch.B. in 1916 with honours, and in 1926 proceeded M.D., again with honours, and with the added distinction of the Bellahouston gold medal. As an undergraduate he took a prominent part in the various activities of academic life and held the positions of convener of games in the Union and of president of the Medico-Chirurgical Society. In 1916 he joined the R.A.M.C., holding on demobilization the rank of acting-major and being awarded the Military Cross. On his return he was appointed assistant to the professor of materia medica and therapeutics at Glasgow University and in 1921 he became Pollok Lecturer. During 1925-26 Dr. Campbell engaged in research work, lecturing and giving instruction in laboratory methods in the department of pharmacology of the Johns Hopkins University, Baltimore. He has acted as examiner in materia medica at Glasgow, St. Andrews, and Aberdeen Universities. Dr. Campbell has also taken an active part in hospital work, and is at present a physician to the Glasgow Western Infirmary.

Prevention and Treatment of Diphtheria in Dundee.

The medical officer of health of the city of Dundee (Dr. W. L. Burgess), in his report for the year ended December 31st, 1929, states that this period was satisfactory in his area so far as diphtheria is concerned. There were 437 notifications, as against 623 in 1928, and the thirteen deaths gave a case mortality of 2·97 per cent., the lowest figure yet recorded in Dundee. The steady fall in the fatality of diphtheria seems to be directly related to the active adoption of measures designed to ensure early administration of the specific remedy, and the year's experience supports the view that deaths would be less frequent if antitoxin was administered at once in every case in which the possibility of diphtheria could not be immediately excluded without assistance from the laboratory. The arrangements made in Dundee for the free supply of antitoxin and of outfits for its administration have been improved, and any doctor who applies to the department of the medical officer of health can obtain an outfit, to be retained by him for use in an emergency, a fresh outfit being supplied for one that has been used. Moreover, every outfit is exchanged at the end of a month, in order to ensure the potency of the antitoxin and the sterility of the syringe. Active immunization by toxoid-antitoxin and Schick testing are not favoured by the general public. Dr. Burgess states that it is very difficult to stimulate and sustain interest among parents in this subject when diphtheria is not epidemic and the danger is not imminent. In 1929 there were 497 Schick tests carried out in Dundee, and it was found that grouping the patients under three age groups—namely, under 5 years, 5 to 15 years, and over 15 years—positive reactions were obtained respectively in 6·38, 10·62, and 21·58 per cent. Altogether 227 persons received three intramuscular injections of toxoid-antitoxin at intervals of one week, including fifty of the persons who had been tested and found Schick-positive. It is interesting to note that four notifications of diphtheria concerned persons who had been tested or immunized during the year: in two of these cases the diagnosis of diphtheria was not accepted; one had received a third immunizing dose on February 4th, 1927, and was notified as a case of diphtheria on October 1st, 1929, when the diagnosis was confirmed clinically and bacteriologically; the other, found to be Schick negative on August 9th, 1929, was notified as a case of diphtheria on November 4th, and though the diagnosis was confirmed clinically all the swabs were negative.

Ancient Leper House at St. Andrews

During digging operations on St. Nicholas Farm, opposite the East Sands, St. Andrews, a number of human bones, evidently of great age, have been unearthed. The farm stands on the site of an ancient leper house known as St. Nicholas's Hospital. So far as existing knowledge goes, St. Nicholas's was one of the earliest leper houses in Scotland, having been founded between 1177 and 1214. As on the Continent, some of the leper hospitals in Scotland, besides serving for the isolation of the infected, were founded and endowed as religious houses. From charters still in existence it appears that St. Nicholas was so dedicated. If so, not a vestige of the religious buildings remains, but there is good reason for believing that the finding of the bones, which are stated by Dr. Lennox of St. Andrews University to belong to the fourteenth or fifteenth century, has revealed the site of the burial place of the lepers who died in the hospital.

William Mackenzie Medal

The William Mackenzie medal 'for original contributions to ophthalmology of outstanding merit' has been awarded to Professor J. van der Hoeve of Leyden, Holland. He will deliver an address at the Glasgow Eye Infirmary on October 3rd, at 8.30 p.m. on the subject of ophthalmology in its relation to the other branches of medical science.

Ireland.

St. Patrick's Hospital, Dublin.

THE Governor-General of the Irish Free State recently visited St. Patrick's Hospital and performed the opening ceremony of a new wing and a number of additional rooms for the special treatment of patients. The new wing consists of a fine three-story building with vita-glass windows. The rooms are all fitted out in a bright manner, with modern conveniences and appliances. The roof, which is flat and railed in, commands a splendid view of the city and Phoenix Park. Introducing the Governor General, Chief Justice Kennedy said that the hospital was one of the most historic institutions in Dublin, being founded by Dean Swift by a bequest of virtually all his property under his will. It was constituted shortly after his death by a charter, which was the first State recognition of the institution, granted in the time of King George II. in the year 1747. Several other necessary additional charters were granted, as a result of which the institution felt itself within the eye and favour of the State. It was the first hospital devoted to the treatment of mental diseases in Ireland, and for many years the only one. The present additions had all been made out of the funds of the institution, which had been wisely administered. There had not been, nor would there be any appeal to the public for funds. The Governor-General said he was glad to be associated with the opening of the new building. He need not enter into details as to the additional services which it would enable St. Patrick's Hospital to render to the mentally afflicted. The important points to recognize were that it would afford better facilities for methods of treatment which had in recent years been found to be beneficial, and that the already high percentage of recoveries among patients should consequently be raised in the future. History dwelt on the personally pathetic side of Swift's generous bequest. It did not dwell on the difficulties of his executors in realizing that portion of the bequest which consisted of loans recoverable from poor men trying to develop business in Dublin. Swift's practical sympathy with poverty or suffering did not begin to operate at his death, though his bequest made it possible to found the first, and for half a century the only, hospital in Ireland for the relief of mental sufferers. Among the distinguished medical men who had been associated with it must be mentioned one physician who was publicly thanked for his sympathetic efficiency. Dr. Emmet, the first paid physician, was the father of Robert Emmet. The Governor-General did not doubt that this hospital and its branch at

Lucan would continue to preserve the eighteenth century traditions of charitable helpfulness and of sympathetic efficiency, and that its governors would always, as now, recognize professional efficiency by removing obstructions to the application of steadily advancing medical knowledge Dr Leeper, medical superintendent, said that in 1731 it was in Swift's mind to build a hospital called Bedlam, in Dublin In 1735 there was issued from his garret in Molesfields—then the site of Bedlam—a scheme for the foundation of a hospital for incurables This hospital for incurables was to admit incurable fools, incurable rogues, incurable liars, and the incurably vain and envious were to be eligible for admission on an urgency order Swift suggested that, at the foundation, he himself should be admitted on a certificate as an incurable scribbler They had recently obtained a photograph of a letter written in 1735 by the Dean to Exton Staunard, Recorder of the city of Dublin, setting forth his intention to found St Patrick's Hospital In 1740 Swift wrote

> "He gave the little wealth he had,
> To build a house for fools, or mad,
> And showed, by one satiric touch,
> No nation wanted it so much"

It was not until 1815 that Grangegorman Mental Hospital, the parent of all the district mental hospitals in Ireland, was erected Dean Swift stated, with prophetic foresight, that if a hospital extended from here to the Phoenix Park there would be always more applicants for admission than there would be room for This prophecy, in its partial fulfilment, explained the extension which His Excellency was there to open that day The governors found extension necessary because of the larger number of patients voluntarily seeking treatment, this voluntary coming forward was due to the gradual dissipation of the old idea of a difference between disease of the brain and nervous system and diseases of other organs, and the growth of a more rational outlook on the causation and treatment of mental diseases The governors of the hospital had provided them with every means for carrying out every modern therapeutical method for the alleviation and cure of all forms of mental disease, and the recovery rate for the past thirty years had never fallen below 50 per cent of the admissions This figure did not include many patients who had been so far relieved as to live at home with their relatives and lead happy and useful lives That the work of the hospital was appreciated was proved by the fact that patients were daily admitted from all over Ireland, North and South (for insanity had no boundary, though sanity might have), and that more patients had been admitted during the past ten years than were admitted in the previous fifty years of the hospital's existence

Immunization Against Diphtheria.

Dr M J Russell, medical officer of health, in his report to the Dublin City Commissioners, states that in 1928 there were notified to his department 407 cases of diphtheria, and 500 cases in 1929 Notwithstanding that they had a well-equipped disinfecting station and adequate hospital accommodation for the isolation of patients they did not seem able to make any satisfactory impression on the incidence of this disease in the city About half the patients were of pre-school age, and two-thirds of the deaths of those afflicted occurred in that group Dr Russell was convinced that the only effective means of eradicating and preventing the disease was by immunization He had selected Dr Denis F Hanley, Cork Street Hospital, to carry out this work at the Carnegie Centre at a fee of £2 2s per session of two hours a week, and the Local Government Department approved the arrangement In addition, he proposed to supply the necessary serum to suitable children's hospitals where the work of immunization might be undertaken A sum of £400 had been provided in the current estimate to cover this service On the other hand, there might be a considerable saving by the reduction of the number of cases of diphtheria to be dealt with in fever hospitals and chargeable against public funds, whilst such a result from the public health point of view would be of inestimable value

Problem of the Feeble-minded

Professor John Cooke, M A, in a recent address on feeble-minded children, stated that when Queen Victoria came to the throne there was not a single Act of Parliament specially intended to shelter children from the wrongs inflicted on them in any one way At the close of her reign there were about 100 Acts in which children were concerned Ireland has shared in all the benefits of this work for children, and here in Dublin in the forty years of the activities of the National Society for the Prevention of Cruelty to Children no fewer than 100,000 children had passed through the hands of its able and devoted officers Every effort was made by those interested in the mentally deficient to get the British measures extended to Ireland, but this was not done, due to that perverse parliamentary action which "*did not apply to Ireland*" That Ireland sorely needed the mercy extended to the afflicted was shown by the estimate made in 1906 There were 25,415 mentally afflicted persons in the country outside of asylums, and 66 per cent were in immediate need of provision being made for them, as against 44 per cent in England and 34 per cent in Scotland

England and Wales.

Vital Statistics for 1929

Some of the figures recorded in the tables that make up the Registrar-General's *Statistical Review of England and Wales for the Year 1929*[1] are in marked contrast with those of the previous year In that year a number of "records" were established, most of them indicative of improvement in the public health The birth rate was 16 7, which, except for the rate in 1927, was the lowest on record The standardized death rate—namely, the rate that would have been recorded if the sex and age constitution of the population had been the same as in 1901—was 9 9, lower than in any other year The death rate of infants under the age of one year was 65 per 1,000 births, also a record figure The mortality from epidemic diseases was far less than in the previous year, notably the death rate from influenza, which was the lowest since 1914. The mortality from diseases of the respiratory system was the lowest recorded On the other hand, the crude death rate from cancer (1,425 per million living) was higher than in any previous year, and maternal deaths from puerperal sepsis and accidents of pregnancy and childbirth reached 4 42 per 1,000 live births—the highest figure recorded in the eighteen years for which comparative figures were available In 1929 the birth rate fell to 16 3, a figure even lower than that recorded for 1927 On the other hand, the deaths of infants under one year of age were equal to a rate of 74 per 1,000 live births, or 9 per 1,000 above the rate recorded during 1928, and the general death rate rose to 13 4 per 1,000 persons living, representing a standardized rate of 11 5, which was higher than any since 1919, when the crude rate was 14, a figure based on the deaths of civilians only. These increased rates were due almost entirely to the high mortality from respiratory and circulatory diseases and to the epidemic of influenza during the abnormally severe weather in February and March In the March quarter the general death rate actually rose to 20 9, no less than 5 8 per 1,000 above the average for the first quarter of the eight preceding years, while the rate for the rest of the year was slightly below the corresponding average for the same period With the exception of the pandemic of 1918–19 the epidemic of influenza was the most severe that had been experienced in this country since 1890–91, the mortality being 734 per million persons living, against only 196 in 1928 The mortality from respiratory diseases rose from 1,507 per million in 1928 to 2,104 per million in 1929, and the mortality from circulatory diseases reached the record figure of 3,030 per million, largely owing to the deaths of elderly persons during the severe

[1] *The Registrar General's Statistical Review of England and Wales for the Year 1929* (New Annual Series No 9) Tables Part I Medical H M Stationery Office 1930 7s 6d net

weather of the first quarter. The death rate from cancer continuing the steady though slight increase that has been taking place in recent years, and representing the highest crude rate on record. The increase affected both sexes but females rather more than males. There was a slight decline in the maternal death rate from puerperal sepsis and accidents of pregnancy and childbirth (4.33 per 1,000) but the improvement was in respect of accidents of pregnancy and childbirth, the death rate from puerperal sepsis having actually undergone a very slight increase from 1.79 to 1.80. It may be noted that the puerperal mortality rate is still above that experienced in any of the years 1921–27. The suicide rate which had declined in 1928 from 125 to 124 per million living, rose in 1929 to 126, the highest figure on record. The female suicide rate (73) was higher than in any previous year, and the male rate (183) was only 1 per million less than the male record in 1927. Death returned by His Majesty's coroners as resulting from motor accidents rose from 4,492 in 1927 to 5,251 in 1928 and 5,799 in 1929. Excluding deaths from collisions between two different types of vehicles, the deaths caused by motor cars increased from 1,550 to 1,660, by motor cycles from 1,043 to 1,162, and by motor vans, lorries, etc., from 936 to 1,162.

The Red Cross Rheumatism Clinic in London.

The British Red Cross Society's clinic in Regent's Park for the treatment of rheumatism, which H.M. the Queen declared open last March, reopened on September 1st after being closed for a month. Extensive internal reconstruction has been carried out, and the accommodation has now been practically doubled. A report on the results of the first five months' work states that from the start the numbers attending for treatment were much bigger than was anticipated, and it was found necessary to close down the clinic during August so that adjustments could be carried out in the internal organization to enable a greater number of patients to be treated. From the beginning of the year applications began to be received and when the clinic closed nearly 300 applicants were waiting for appointments, and over 200 women—the number of women patients as is usual in all rheumatic clinics has always exceeded the number of men patients—were awaiting treatment. In future the clinic will be open from 8.30 a.m. to 9.30 p.m. This, with the structural changes, the increase in the number of dressing rooms and waiting rooms, the duplication of equipment and the appointment of additional staff will enable patients to be passed through much more quickly. In the past men and women have been treated on alternate days; arrangements have now been made by which both sexes can be treated on the same day. During the period it was open 24,986 treatments were given. A gratifying sign was the steady growth in numbers of patients attending; there was also a steady increase in the number of patients sent by friendly societies, largely at whose instance the Red Cross Society decided to undertake its campaign against rheumatism. Apart from treatment useful work was undertaken at the clinic in the form of diagnosis and in the weeding-out of patients who were not suffering from rheumatism. Records are being kept of the occupations of all patients attending, and it is hoped that much information about the occupational causes of rheumatism will be obtained. Considerable use was made of the clinic by private patients; it is hoped that their numbers will increase and so help to finance the treatment of patients unable to pay the normal fees; in July alone over 1,000 treatments were given on the private floor. Five honorary visiting physicians with fifteen clinical assistants started work at the clinic when it reopened. The staff now consists of a medical registrar, the sister in charge with sisters in charge on each floor to assist her, fifteen masseuses, ten masseurs, as well as a lady almoner and her assistants. Six new consultants—a dental surgeon, a radiologist, an orthopaedic surgeon, a throat specialist, a surgeon and a gynaecologist—have been appointed. For patients sent by approved societies the course of treatment, which involves nine attendances, costs 25s. with subsequent courses, if necessary, at 20s. For private patients treatments cost 10s. 6d. each, in addition to a consultation fee to the consulting physician of £2 2s. World-wide interest has been taken in the clinic and deputations from 10 trial Germany, France, Holland, the United States, and other countries, most of which already have rheumatism clinics of their own, have come to inspect it.

Correspondence.

PERFORATING DUODENAL AND GASTRIC ULCERS

SIR,—Mr. J. H. Watson's valuable paper in the *Journal* of August 2nd (p. 169) on acute perforating duodenal and gastric ulcers interested me greatly, and I should like to make a small contribution to the record of the earlier cases if only to bring due credit to British surgery.

My attention was particularly directed to these cases in 1896, when in consultation with Dr. Bremner of Exeter (afterwards of Canterbury) I saw a woman aged 25 who had been seized with severe abdominal pain two and a half hours after a meal consisting of a meat pastry and cocoatina six and a half hours after the attack. I had no difficulty in diagnosing at any rate to my own satisfaction the existence of a perforated gastric ulcer. To my surprise and deep regret the admitting surgeon at the hospital did not concur but gave it as his opinion that the patient was suffering from ovarian haemorrhage"! Thus no operation was undertaken but three days later at a post-mortem examination a perforation of the stomach was found with portions of the pastry free in the peritoneal cavity.

I was then convinced that this subject had not received sufficient consideration and in 1897 I read at Cambridge a thesis for the degree of M.D. dealing with this subject among others.

I had of course to make a careful investigation of the bibliographs and the following references are of interest in this connexion.

Mr. Pearce Gould opening a discussion on the subject in the Surgical Section at the Annual Meeting of the British Medical Association at Bristol in 1894 (*Journal* 1894, vol. ii., p. 859) mentioned six successful cases—namely, those of Taylor, Barling, Kriege, Morse, Maclaren and Telford. He added that Mr. Henry Morris permitted him to mention a seventh but he gave no references. Mr. Hastings Gilford read a paper before the Reading Pathological Society (see *Journal* 1893, vol. i., p. 944) giving a list of seven cases previously recorded but he seems to have had great difficulty with his reference.

However I was able to collect by 1897 no fewer than 75 cases of operation for acute perforation and the following ones have a bearing on priority.

Fatal Cases.

The first recorded operation which I found was one reported by Simon and Barling which was performed on July 16th 1891 (*Birmingham Medical Review*, August 1891, p. 103) operation six hours after perforation—death.

The second was performed on October 14th 1891 and reported by these two authors (*Journal* 1892, vol. i., p. 63, and also in the *Birmingham Medical Review*, September 1893, p. 131) operation about ninety hours after perforation which occurred on October 10th—death.

Maclaren of Carlisle reported an operation performed in October 1891 (*Journal* 1894, vol. ii., p. 863) about nine hours after perforation—death.

A fourth operation was performed by C. E. Ingon Wellington, New Zealand, on September 11th 1892 (*Lancet* 1893, vol. i., p. 469) twenty-four hours after perforation—death.

Hastings Gilford performed an operation on October 19th 1892 (*Journal* 1893, vol. i., p. 944) ten and a half hours after perforation—death.

Early Cases of Recovery.

Havard and Owen reported at the Clinical Society on January 13th 1893 (*Journal* 1893, vol. i., p. 116) without giving the date a case operated on about eighteen hours after perforation. The ulcer was attached to the anterior abdominal

wall, and a drainage tube was inserted The patient was well one month after the operation This case was mentioned by Mr Pearce Gould at the Bristol Meeting of the British Medical Association in 1894

On June 22nd, 1893, Hastings Gilford operated eight and a half hours after perforation (*Lancet*, 1894, vol i, p 1369) He definitely states that he sutured the ulcer, irrigated the peritoneum, and closed the abdomen except for a drainage tube Recovery ensued This appears to be the first recovery following this procedure

On February 4th, 1894, Maclaren operated on a case nine hours after perforation He states that flushing was very thorough, but he does not record the treatment of the ulcer, recovery ensued (*Journal*, 1894, vol ii, p 863)

On March 13th, 1894 (*Lancet*, 1894, vol i, p 671), Morse of Norwich reported a case, without giving the date, in which he operated five hours after perforation He states that the perforation was closed with Lembert sutures, that the abdomen was washed out, and the external wound closed, recovery ensued

I may, perhaps, conclude by mentioning two interesting points which emerged from my collection of cases In 71 cases in which results were given, there were 29 cases of recovery, in only 6 of which did the interval exceed 10 hours In 42 cases in which death ensued, there were only 7 in which the interval was less than 10 hours Several surgeons appeared to be very hazy about the surfaces of the stomach, thus, such records as "I drew up the stomach and found the perforation on the posterior rather than the anterior surface" were not uncommon Attention was also drawn to this point in a new edition of Greig Smith's book which appeared a few months after I had read my thesis — I am, etc,

Exeter, Aug 21st RUSSELL COOMBE

SIR,—I have just noticed that Mr John H Watson of Burnley, in his very interesting paper on perforated duodenal and gastric ulcers (August 2nd, p 169), has quoted some figures which he attributes to me dealing with my cases from 1903 to 1927, and showing a mortality of 25 per cent I do not know where Mr Watson can have got this information because I am not aware that I have published any communication on this matter since the time of my lecture before the Hunterian Society in London in January of 1925 That lecture was reported in the *Lancet* and the *British Medical Journal*, but it was not published in extenso At that time I quoted my cases arranged in a table as appended (I), and showing an overall

TABLE I.—*Perforated Gastric and Duodenal Ulcers*
Excluding localized perforations (shut off from the general peritoneum), incomplete operations (drainage only, without suture of the perforation) and cases not operated upon (To end of 1924)

Over 24	14	8	6	42 85
Grand Total	147	124	23	15 64

All cases operated upon within twelve hours total 98 cases with 8 deaths, or 8 16 per cent

mortality of nearly 16 per cent I have now brought my cases up to the end of 1929, and in order to get a reasonable series for statistical purposes I have, with his permission, added the particulars of 208 cases operated upon by my friend Mr Norman Hodgson, who was for many years my assistant, and whose methods and ideas on the subject are practically identical with my own As a result I am able to present a second table (II) dealing with 365 cases and an overall mortality of 15 06 per cent Now that our students and practitioners are becoming more familiar with the diagnosis of this emergency, and that transport is so very much improved, I think it is reasonable to expect that most cases should reach surgical aid within twelve hours If that could be done, then probably

TABLE II.—*Perforated Gastric and Duodenal Ulcers*
Excluding localized perforations (shut off from the general peritoneum) incomplete operations (drainage only, without suture of the perforation), and cases not operated upon (To end of 1929)
Personal Statistics, Professor Grey Turner and Mr Norman Hodgson

No of Hours of Perforation In 6-hour Periods	Total No	Recoveries	Deaths	Percentage of Deaths
Up to 6	119	115	4	3.36
7 to 12	148	129	19	12 83
13 to 18	40	33	7	17.5
19 to 24	21	15	6	8 57
Over 24	37	18	19	51.35
Grand Total	365	310	55	15 06

All cases operated upon within twelve hours total, 257 cases with 23 deaths, or 8 61 per cent

we might expect a mortality of something under 10 per cent, which I should consider not ideal, but reasonable, considering the extreme gravity of this calamity — I am, etc,

Newcastle-upon Tyne, Aug 30th G GREY TURNER

ETIOLOGY OF PUERPERAL SEPSIS

SIR,—Dr Armstrong and Mr Burt-White (August 23rd, p 305) attach little importance to the presence of anaerobic streptococci in the blood stream of seventeen patients, as reported by me in the *Journal* of July 26th (p 134) because, as they suggest, the patients were a specially selected group of cases with thrombo-phlebitis, and not examples of ordinary puerperal fever Further reference to my paper will reveal that the cases were not in any way selected I included in my survey every case of puerperal fever investigated by blood culture during a period of twenty months, and the survey embraced the *whole* of the septic infections occurring in the largest maternity hospital in London—namely, Queen Charlotte's They will find also that there was definite evidence of thrombo phlebitis in only one-third of the cases giving positive blood cultures of anaerobic streptococci Even if we assume, as do Dr Armstrong and Mr Burt-White, that all the cases were characterized by septic thrombosis, does it follow that they are not to be regarded as cases of puerperal fever? I would ask, moreover Is it undesirable to discuss the bacteriology of such cases for fear of adding "yet another group to the terrifying array of pathogenic streptococci"? I find it difficult to understand that attitude

The conclusion reached by Dr Armstrong and Mr Burt White that the cases reported by me were infections by various endogenous streptococci and other organisms, occurring as a sequel to intrauterine manipulation and trauma, is precisely the conclusion drawn by me and tentatively suggested in my paper We differ, however, in our estimates of the importance of these infections Dr Armstrong and Mr Burt-White, apparently influenced by the fact that the anaerobic streptococci they had met with were of low pathogenicity for laboratory animals, infer that these microbes can do little harm to human beings Since I have seen seven women die from these infections, and as many more in grave danger, during the past two years, I am inclined to attach considerable importance to them During the two months that have elapsed since my paper was sent in anaerobic streptococci have been isolated from the blood of three more patients, two of whom are in very grave danger at the time of writing, while the third has recovered from her infection, but become insane

In conclusion, may I reaffirm my belief that until we have more precise data of the kind reported recently by Professor Hedley Wright and Mrs Taylor (*Journal of Obstetrics and Gynaecology of the British Empire*, Summer Number, 1930, p 213) and in my own paper, most of our discussions about the etiology of puerperal fever are but

waste of time We are only now beginning to get these data The new isolation block attached to Queen Charlotte's Hospital, which was opened on September 1st at Hammersmith, for the reception of any patients in or around London suffering from puerperal fever, will enable us to study the problem much more satisfactorily than has been possible heretofore —I am, etc ,

London W.2 Aug 27th. LEONARD COLEBROOK

"THORACIC STOMACHS"

SIR —Mr A Brown Kelly by his letter on thoracic stomachs (August 30th, p 336) gives me an opportunity, which I welcome of further ventilating this subject He charges me with confusing terminology by applying to the dilatations of the gullet, occurring with pharyngeal pouch and cardio pasm, the picturesque title "thoracic stomachs" He complains that the term has already been chosen by him for a congenital defect in which the stomach develops above the diaphragmatic level With his demand for a pure nomenclature I fully sympathize, but the ideal must not be allowed to dominate to the *detriment of human needs* Is not Mr Brown Kelly running the risk of allowing exactitude of terminology to override the more practical humanitarian aspect of medicine?

First my title is a purely clinical one, and by diagrams, I showed clearly that the conditions I described are adventitious pouches of the gullet, while the normal stomach is also present below the diaphragm No medical reader could confuse them with congenital intrathoracic development of the stomach Secondly, the congenital malformation is so very rare as to be of comparatively small concern to humanity My use of the title serves to capture the imagination of the reader and refresh his memory on two very serious disorders which, taken together, form a most important, and not infrequent, group of alimentary troubles I repeat that these dire disorders are out of sight and, therefore, apt to be out of mind as witness the frequency with which the victims give long histories of ineffectual treatment Thirdly, my use of the title in connexion with but two conditions does not preclude its embracing within its scope others—namely diaphragmatic hernia of the normal stomach or developmental malposition of the stomach in the thorax Indeed, I hinted at this by the reference to diaphragmatic hernia in the early part of my article

Mine is a clinical title, and, since the greater includes the lesser, the clinician will not wish to confine its name to *any one type of thoracic alimentary pouch, but will prefer* to make it a generic term for the whole group of which pharyngeal pouch and cardiospasm form subdivisions of paramount importance by reason of their greater frequency and notable amenability to surgical relief —I am, etc ,

Clifton Bristol Aug 31st. A WILFRID ADAMS

MASSIVE COLLAPSE OF THE LUNG

SIR —A letter in your issue of August 30th (p 334) by my friend Dr P Watson Williams has drawn my attention to the above subject The name of Dr Watson-Williams is always to me a sufficient guarantee that there is something worth reading, otherwise the subject would have passed unnoticed I shall leave him to deal with the deflated fancies of Dr Woodburn Morison and Dr Pasteur, but as some of his own ideas require a little inflation I venture to quote the following paragraphs from my Bradshaw Lecture in 1907 [1]

We have seen how the lung is kept expanded by the negative tension within the pleura, and the greater and more active the inspiration the greater the negative pressure but not unfrequently, especially in many wasting diseases where the demand for oxygen is not great this negative pressure may fall to a very low ebb or may disappear so that partial atelectasis of one or both lungs or almost complete atelectasis of one lung is not at all uncommon This is especially apt to occur in young flat-chested individuals with pliant chest walls Perhaps I have seen a greater number of these cases than has fallen to the lot of most men for the simple reason that for many years I have been on the look-out for them. These cases are frequently overlooked because there is usually a negation of subjective chest symptoms and so the lung is often allowed to remain so long collapsed that it never completely expands and afterwards the deficient expansion of one side of the chest is supposed to be the result of some old pleural effusion of which the patient has no recollection When these cases are discovered in the early stages they are usually mistaken for pleural effusion—an error which is apt to remain uncorrected if an exploring needle be not inserted into the chest I showed the skiagraphs of a couple of cases which were tapped in several places with a negative result and afterwards such diagnoses as sarcoma of the lung unresolved pneumonia etc arrived at My opinion that the conditions were simply due to atelectasis which could be removed by respiratory gymnastics was at first received with credulity, but the subsequent improvement in the cases and the nonfulfilment of the grave prognostications proved the correctness of my views I have seen this condition occur in typhoid fever, infective endocarditis pyaemia etc In one severe case of typhoid fever an energetic consultant came to the conclusion that a mistake had been committed and that he had to deal with a case of empyema but he had to acknowledge his own mistake when he found the pleura quite empty I had subsequently the opportunity of explaining the correct nature of the condition which in this instance was cured by making the patient lie on the other side.

With care atelectasis is easily differentiated from pleural effusion even when the dull percussion is absolute and the respiratory and vocal phenomena absent In atelectasis of one lung the affected side is smaller than the other the ribs are closer together and more sloping the costal angle more acute the diaphragm raised the dull percussion barely reaches the middle line in front while the sound lung passes beyond the mesial line, the heart is either not displaced or slightly pushed over by the sound lung Forcible rubbing of the affected side acting through the lung reflex of Albert Abrams causes some expansion of the lung and clears up the percussion note. This is also accomplished by forcible expiration or better by Valsalva's method Everyone who has attended a case of parturition knows how a vigorous child expands its lungs and in the treatment of atelectasis in the adult you cannot do better than imitate Nature, minus the howl

—I am, etc ,

Hindhead Aug 30th JAMES BARR

[1] *British Medical Journal* November 8th, 1907 p. 1272

ANTIMALARIA MEASURES

SIR,—Colonel Gill's letter in your issue of August 16th furnishes an explanation of the extraordinary statements he made (April 12th) about those of the 'old school' and myself in particular, being 'completely satisfied with the state of scientific knowledge attained some thirty years ago", of our being uninterested in research and of "unsubstantiated claims" made by the 'old school' Colonel King, Dr Tertius Clarke, Dr Scharff Mr Senior White, *and others have so fully shown the absurdity and inaccuracy* of Colonel Gill's statements that I need add nothing In fact in my letter from Rhodesia published on July 5th, I made no attempt to prove to Colonel Gill that white was not black and that two and two made four It would have been a waste of time in his then state of mind, and unnecessary for those who know the work, scientific and practical, done in Malaya and elsewhere by members of the "old school"

But I could not help wondering how Colonel Gill came to create for himself these delusions Now we have the explanation. In his letter (published August 16th) he tells us that when I visited his laboratory in Lahore in 1924 I "spoke slightingly of the value of laboratory studies in malaria, and displayed little interest in a specially arranged exposition of the technique employed in the study of the epidemiology of malaria' So there you have the paws, nose and ears—the whole beast out of the bag Colonel Gill has evidently been brooding over this imaginary slight with disastrous results

Having diagnosed the case now let me treat the patient It will comfort Colonel Gill to know that I believe there is 'no single method of malaria control applicable to all conditions and all countries (vide Resolution 2 moved by me at the Congress of the Far Eastern Association of Tropical Medicine Calcutta, 1927) Nor am I looking to the future to give us one single method It will also comfort Colonel Gill to know that were there in force anti malaria measures giving 100 per cent success in every malarial area in the world I would still urge research believing that fuller knowledge will lead to a lowering of

the cost of the control work Now for a tonic You can't "search out and study the secrets of Nature by way of experiment" in a laboratory alone, as, in substance, I told Colonel Gill in 1924, and so upset him We require far more scientific work in the field than we have had in the past to control the results of work in the laboratory—for example, the misleading laboratory findings in regard to anopheles carriers We need the scientist who can experiment in miles as well as in millimetres And if Colonel Gill doesn't believe me, perhaps he will ponder over the words of the distinguished scientist which I quoted in my original letter of February 8th "There is a certain type of man who is badly wanted at the moment That is the scientific man who can administer, the administrative man who knows science We have men who can explore in the laboratory, but we have not enough men who can take what is discovered into the world We want people who are not merely scientists, we want people willing to take responsibility" Finally, to complete the cure I recommend a change of air and travel Let Colonel Gill visit the work done by Mr Senior White and Dr G C Ramsay in India, and then visit Malaya, to hear and see the practical and scientific work done by Hoops, Schaiff, Wellington, Macaskill, Barrowman, Hunter, Dawson, Scott, Daniels, Leicester, Stanton, Strickland, Hacker, Lamborn, Williamson, Gater, and others

Reverting to the original subject, antimalaria measures in Africa, I have just returned from a tour on the Congo-Rhodesian border, the Low Velt, and Zululand On the Selection Trust Mines in Rhodesia, the antimalaria work commenced by Sir William Simpson, Dr Dalzell, and Mr Harrison nearly a year ago is rapidly nearing completion, and promises to give the results that the "old school" would be much surprised if they did not get Much interesting scientific work is being done in the field, and in the laboratory, which (Colonel Gill *nota bene*) *I myself* sent out to the mines I also saw great opportunities for work on Malayan methods throughout my tour, and I have no doubt the future will show their adoption on a considerable scale in Africa Less than ever, after my tour in Africa, am I inclined to sit down and allow the mosquito, uncontrolled, to work its will on man, and leave him to acquire after years of sickness that very imperfect thing—immunity to malaria—I am, etc,

MALCOLM WATSON,
Putney Heath, S W 15, Sep 4th Principal Malaria Department, Ross Institute

THE LISTER WARD

SIR,—In a footnote to the extremely interesting paper by Lord Moynihan recently read at Winnipeg[1] there were some remarks as to the misconduct of the managers of the Glasgow Royal Infirmary in pulling down the Lister Ward With that attitude of mind I am entirely in sympathy There never has been in the world's history an act of greater vandalism, but I think the reference to that might well have made mention of the fact that the managers of the Royal Infirmary were by no means unanimous I happened to be at that time on the board of the Royal Infirmary, I think as president of the Royal Faculty of Physicians and Surgeons, and I moved an amendment to the effect that the matter should be delayed for further consideration That amendment was duly seconded, and on a vote the amendment was supported by eight directors The original motion to destroy the building was moved by the chairman of the hospital I am not sure who seconded the motion, but it certainly was supported by Sir Donald Macalister, principal of the University, and by the honorary treasurer of the infirmary Sixteen directors approved of the destruction, as already mentioned, eight disapproved, and I think it would only have been fair to the eight had the footnote mentioned the fact that a strenuous effort was made to save what was the most valuable building in the medical world I hope in future that persons who write on this deplorable incident will take care to record that one-third of the directors who attended that meeting did not approve of the action of the majority —I am, etc,

Rothesay Sept 1st A FREELAND FERGUS

[1] *Canadian Supplement to the British Medical Journal* August 30th 1930 p 10

THE CUSTOMS AND BELIEFS OF MANKIND

SIR,—I well remember one of my seniors, some five and-twenty years ago, expressing his regret that I had no hobby, apart from my work Being too shy to contradict my respected friend, I did not confess, but as a matter of fact I was, even at that remote time, a secret tippler of at least two varieties of potent spirit, one of them being folk-lore, or the study of the customs and beliefs of mankind So you may easily understand with what pleasure I have seen this hobby recently receive the commendation of the *British Medical Journal* It is, indeed, an appropriate pastime for the medical man But there is one aspect which, curiously enough, has escaped the notice of your contributors, although this side of the subject is one which renders it of quite peculiar interest to the practising doctor, wherever his lot may be cast, at home or abroad, and that is its close and abiding relationship with popular medicine, and through it with the history of medicine itself

In a brief communication like this it is, of course, impossible to enter even superficially into this fascinating subject, but I can most cordially support you in your commendation of the study of folk-beliefs, not only for its own sake, but also because it furnishes its votaries with a key to the comprehension of how the uninstructed mind views the human body, its functions and their disturbances —I am, etc,

London, W 1, Aug 30th DAN MCKENZIE

PERSONNEL OF A RADIUM CLINIC

SIR,—Mr Duncan Fitzwilliams concludes a most instructive and illuminating article (August 30th, p 309) by a reference to what he regards as the necessary personnel at a radium clinic His team is as follows surgeons, laboratory workers (whatever these may be), biologists, and physicists Being himself a surgeon it is possibly not unreasonable that he should put surgeons first But though he refers to Paris and to Stockholm as places where team work has brought the treatment of cancer by means of radium to a high state of efficiency, he omits absolutely (as is all too common in this country) to mention the radiologist, yet one thinks of Stockholm in connexion with Professor G Forssell, and of Paris in a similar relationship with Professor Regaud To these two men the whole of the building up of the great work in these countries is due Are we so much better than they? Possibly Mr Fitzwilliams is including the radiologist under the term "laboratory worker," but he also omits to mention the physician and the pathologist, both of whom, surely, are essential in a well-organized radium clinic —I am, etc,

London, W 1, Sept 1st STANLEY MELVILLE

TECHNIQUE OF RADIUM THERAPY

SIR,—Mr D C L Fitzwilliams in his lecture on "The technique of radium therapy to-day," which was published in the *Journal* of August 30th, states that beta rays are disadvantageous for medicinal purposes, and must be screened off by platinum, lead, or other impermeable metals, since they destroy normal as well as abnormal tissues This is not in accordance with my experience, for I have found the application of a "full-strength" unscreened flat metal plaque of the greatest value in the treatment of rodent ulcer and other superficial conditions, having apparently a selective action on basal cell carcinoma

Further, he asserts that the use of radon (radium emanation) is limited to centres where a radon plant is available, otherwise exact dosage is difficult or impossible to calculate, since it is not always known when it was prepared and how much has been dissipated Surely there should be no difficulty in ascertaining when it was prepared, and its initial strength, its value at any period after its preparation can easily be computed by reference to a table From the point of view of a State service, for economical reasons, the employment of radon has much to commend it, but, on theoretical grounds at any rate, it is inferior to the use of radium salt, since the greater part of its strength is exerted during the earlier part of its application, whereas radium exerts a uniform action during the whole period of its application As Mr Fitzwilliams rightly points out,

the administration of small doses over long periods is superior to large doses over short periods, which argues a superiority in the use of radium as compared with that of radon, and this, I think, can be proved in practice—I am, etc,

Newport Sept. 3rd. W HOWITT HASTINGS

OCCIPITO POSTERIOR POSITIONS

SIR,—Dr Kathleen Vaughan in the *Journal* of July 19th (p 121), states that occipito-posterior positions are unknown among races which habitually squat for urination and defaecation. For four years I was in charge of Maseno Hospital in the Kavirondo Reserve in Kenya, and we repeatedly saw cases with this complication. These people, the "Jaluo," not only squat for urination and defaecation, but also for the greater part of parturition. At present statistics are not available in Africa, but it would be interesting to know what occurs in India, where, I believe, this position is commonly used—I am etc,

Lingfield Sept. 3rd. D STRANGWAYS DIXON
(*of Limuru Kenya Colony*)

SIR,—In your issue of July 19th under the above heading I find a rather surprising observation made by Dr Kathleen Vaughan that it may be of interest that occipito-posterior positions seem to be unknown among races that habitually squat for urination and defaecation." Perhaps it is not generally known in Europe that almost all races in India, as a rule, squat for urination and defaecation, and obstetricians in India could cite cases after cases of occipito-posterior positions in their experience. From my own personal experience of several hundreds of deliveries I can safely assert that no fewer than 8 to 10 per cent of cases are those of occipito-posterior positions—I am, etc,

Bombay Aug 10th. F R PARAKH, M D, M R C S, L.R.C.P.
Consulting Obstetric Surgeon Parsee General Hospital.

NASAL SINUSITIS AND GENERAL MEDICINE

SIR,—Owing to a short absence from London the letter from Mr T Harrison Butler (August 23rd, p 395) has only just come to my notice. He has taken the term "all my eye" as though it were applied to the observation that focal sepsis may be the cause of ocular inflammation. Actually it was quoted in connexion with the term 'abdominal eye," as the title of a poem which many years ago ridiculed a claim to diagnose every ailment by the ophthalmoscope. Mr Butler himself says that any focal sepsis may cause optic neuritis and other ocular inflammations, thus exposing by his own words the fallacy of the term "abdominal eye," which implies some peculiar form of optic neuritis as a sequel to abdominal infections, particularly those of the gall-bladder. The mild flippancy, which Mr Butler resents, represents the correct attitude towards so crude an absurdity.

In the book mentioned it is suggested that errors of refraction may be caused by focal sepsis. Mr Butler says that of course the writer meant, not the optical abnormality, but the symptoms resulting from such errors, which, apart from sepsis, would have caused no trouble. This distinction is the very point criticized, and it might have been expected that an ophthalmologist would be the last to defend a lack of precision. It is a pity that Mr Butler should neglect the main purpose and theme of the review, which was far from unsympathetic—I am, etc,

August 29th. THE REVIEWER

THE PERFORMANCE OF NECROPSIES BY GENERAL PRACTITIONERS

SIR—I was pleased to see the letter from "Pusticus" in the *Journal* of August 9th and still more so to see it followed by others. I have been impressed for years by the absurdity of the fact that we unpractised with no skilled assistance, and with makeshift appliances on unsuitable premises are expected to undertake the sometimes difficult task of finding out the cause of death.

The ideal remedy would be the provision of skilled district pathologists with all proper aids. I suppose the financial obstacle is insuperable. At any rate no adequate person can be expected to undertake a responsible and sufficiently complete examination of a body in existing circumstances for a fee of a guinea and a half, unless he is under an obligation to do it—I am, etc

Colwyn Bay Aug 25th. S L B WILES M D

SIR—I do not quite agree with the opinions expressed by "Rusticus," "A Country Doctor," and "Country G P," in the *Journals* of August 9th and 23rd, about the performance of necropsies by general practitioners. It is regrettably true that general practitioners have very few opportunities of conducting necropsies, but much useful information and knowledge may be gained by taking advantage of such opportunities when they do arise.

In my few years of experience I have had to perform three post-mortem examinations at the direction of the coroner. In the first case (a woman aged 50) several small aneurysms were found on the circle of Willis at the base of the brain, and the largest of these was ruptured, causing an extensive subdural haemorrhage. This accounted for the symptoms of meningeal irritation which preceded death. The second case was that of a man who was killed by lightning. No pathological lesion was found to account for death. In the third case (a man aged 73) there was a haemorrhage into the pericardial cavity, due to a rupture of the anterior wall of the first part of the aorta, just above the aortic valves. This portion of the aorta was dilated, and the anterior wall was abnormally thin. No other gross lesion was found.

These three cases were very interesting and instructive. I should be sorry if general practitioners were denied the privilege of performing necropsies even though they may not have an expert knowledge of pathology and forensic medicine. In cases of difficulty a specialist's opinion can always be obtained. I deprecate the performance of necropsies in private houses, and consider that a mortuary should be available in every district—I am etc

Bristol Aug 30th. RAYMOND T BINNS M B B S

SIR—In 1894 I republished in the form of a pamphlet—"The State and the Doctor"—two papers originally contributed to the *Medical Magazine*. I think the following extract sums up the position to which attention was called by "Rusticus":

Were the State to employ medical men in the way which I have long thought might be made with great advantage I refer to a class of officers one for each county who would be medical jurisconsults. That is men who have made a special study of jurisprudence and were also good practical pathologists of giving evidence and were also good practised in the art It is often almost painful to read the evidence given by medical men at inquests where a sharp cross-examination takes place The medical man has usually come to a right decision in his own mind upon the case but when the possibilities and are you prepared to says come in the lawyer makes such hav of him. One feels that medical men are often made to state what is more or less than their opinion by their inability to withstand cross examination. Moreover this sort of case occurs a man is found dead or dying by the police any medical man living in the vicinity is summoned on his evidence the coroner is communicated with a post mortem ordered and made, by and by unsuspected criminal evidence is imported into the case and perhaps the body has to be exhumed to find that the first examination has practically destroyed the tissues or organs so that no efficient observation can be made. Much of this would be avoided by letting the first medical man testify to fact only and taking the evidence of the county jurisconsult on the scientific possibilities of the case

—I am etc,

Bournemouth Aug 27th. GEORGE MAHOLED

SIR—After thirty years' experience as a rural practitioner may I venture to agree with "Rusticus"? A seven miles journey on a cold winter night to a young local constable who retires after the first incision a small room with an old four-poster bed and a candle, one pail of water

and a dirty towel result, next day, a verdict of "fatty heart" Add to these details a fee which a railway porter would scoff at, out of which must be provided a tip to the aforesaid constable, and another to the local charwoman to clean up the mess The whole thing is a farce In these days of telephones and motors surely a specialist could be appointed As "a Government official" he would, of course, get an adequate fee, out of which he could tip the poor old general practitioner to give him essential particulars —I am, etc,

August 24th "G P"

SIR,—Since my last communication I have come to the conclusion that the unconscious villain of this grisly farce is the non-medical coroner He, with all the might of the law behind him, commands the family doctor of the dead person to perform the post-mortem examination This unfortunate gentleman now finds himself in a sorry fix The law will not allow him to take the only honest course and refuse outright, for the law, like the coroner, assumes every doctor to be an expert pathologist He cannot well confess his incompetence to the coroner and ask to be excused He would be misunderstood by coroner, patients, and public alike, and a less modest and perhaps less scrupulous colleague would profit So he does what we all do He keeps a still tongue, a stiff upper lip, and breathes an inward prayer that some quite unmistakable cause of death will allow him to sleep that night with an untroubled conscience

For the medical coroner who chooses his post-mortem performers at random it is difficult to find any excuse, for he ought to know better At the best he is spending public money with but slight hope of an adequate return, and at the worst he is a consenting party in a not very creditable piece of medico-legal humbug I have been informed of one coroner in a large city who employs only skilled pathologists I hope there are others, but I do not know of them

The matter is serious The most innocent-looking case upon which an unpractised doctor has to perform a necropsy may well have its end in the criminal court, with the life of a fellow creature in the balance How often in the last twenty years have we heard of exhumations for second post-mortem examinations, and how often has the unfortunate doctor who performed the first been brought into undeserved contempt? The number, I believe, is not inconsiderable It behoves us as a profession, therefore, to see to it that a high degree of skill is brought to all post-mortem examinations from the beginning

The remedy is so simple It amounts to this The delusion under which lay coroners apparently labour, that every doctor is an expert pathologist, and every cowshed and back scullery is a suitable post-mortem room, must be finally dispelled Doubtless we shall fall sadly in the estimation of these gentlemen, but it cannot be helped As it is true, we had better confess it rather than wait till we are found out Once they have recovered from the shock of this intelligence the cure follows naturally Every cottage hospital has a mortuary, and a post-mortem room is a simple and logical addition Motor hearses are common, and would-be pathologists will not be lacking

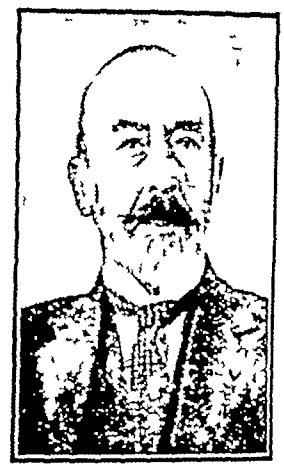
We general practitioners have had our domains invaded by the myrmidons of many branches of official medicine To some our welcome has been chilly, even frosty Should the 'county autopsy officer" ever come into being I, for one, shall take him to my bosom as a brother —I am, etc,

August 23rd RUSTICUS

IDIOPATHIC HAEMORRHAGE IN THE NEWBORN

SIR,—In reply to Dr Montague Dixon's query in your issue of August 30th (p 336), he will find that the good effect of the injection of parental whole blood is described in an article by Helmholz in the *American Journal of Diseases of Children*, 1915, x, p 194 Subsequently J E Welch showed that an equally good effect can be procured by the use of normal horse serum —I am, etc,

London, W 1 Aug 31st. HUGH THURSFIELD



Obituary.

CHARLES BUTTAR, M A, M D,

Chairman, Executive Subcommittee, Central Medical War Committee

BY the death of Dr Charles Buttar on August 31st, after an operation, the medical profession has lost a man of great ability and public spirit, who applied a critical and independent mind to many and diverse professional problems

Charles Buttar was born in London on June 6th, 1867, and had a thorough grounding in the classics at Westminster School Entering Pembroke College, Cambridge, with a scholarship, he took a good place in the Classical Tripos, and then began to read for medicine, obtaining honours also in the Natural Sciences Tripos of 1889, and becoming M A three years later At St Bartholomew's Hospital he did well, and after graduating M B, Ch B in 1892 and taking the Conjoint diplomas he served in turn as house-surgeon and assistant anaesthetist at Barts, house-surgeon to the Metropolitan Hospital, and clinical assistant at the Western Ophthalmic Hospital He obtained the D P H in 1895, and proceeded to the M D degree in the following year With this all-round equipment Buttar became a general practitioner, and worked for many years in Kensington and Bayswater, winning the confidence of his patients and the respect of his colleagues Very quick at absorbing professional knowledge and ready in applying it, he was also businesslike in organizing the day's work, so that amid the claims of a town practice he found opportunity to go about in other circles and exercise his acute brain in many directions—political, philosophical, administrative, and scientific He was one of the earliest medical men to drive a car, and was closely associated with the formation of the Motor Union, which, in 1910, amalgamated with the Automobile Association Before the amalgamation he had served on the Motor Union's committee of medical motorists In 1924 he was elected to the committee of the Automobile Association He took a practical interest in all matters affecting the safety and comfort of motorists, and his wide experience as a driver was invaluable in the provision of warning signs, road improvements, and the development of A A services to touring members

Though he had long been a member of the British Medical Association, Buttar did not come to the front in its affairs until the National Insurance crisis, when he joined forces with the opponents of the bill because of its threat to the freedom of the individual doctor, whose interests he always had at heart He was elected to the Council on four occasions between 1912 and 1923, and served on various standing committees, including the Journal, Finance, Central Ethical, Hospitals, and Naval and Military Committees, he also took an active part in the work of the Ministry of Health Committee, the Post-Graduate Courses Committee, the Non-Panel Committee, and a special committee appointed to consider expansion of military medical services in the event of a national emergency Soon after the armistice he was one of the moving spirits in a small committee formed to advise the Council on the rearrangement of business at the Association's headquarters, in fact, whenever there seemed to be need for fresh ideas and a critical outlook Buttar was usually put upon the body appointed to make inquiries He attended all the Annual Meetings in recent years, and was vice-president of the Section of Medical Sociology at Newcastle in 1921 Perhaps his most successful work for the medical profession was done during the war He saw

at once the need for organizing the civilian profession so that recruitment should proceed on an orderly plan and the medical man power of the country be used to the best advantage To the difficult and thankless task of the Central Medical War Committee he gave of his best, and it was in no small measure due to his efforts as chairman of the Executive Subcommittee that the profession was allowed to retain the management of affairs in its own hands

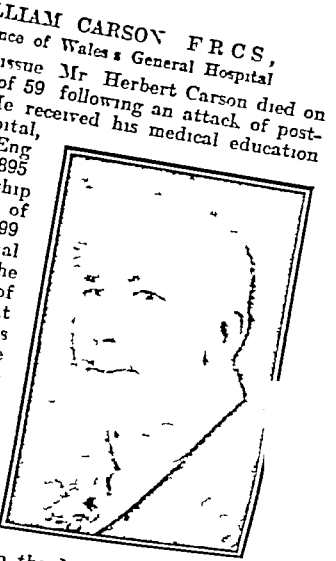
Before leaving the record of Buttar's work in and for the Association we wish to acknowledge his services to the *British Medical Journal*, both as contributor of many unsigned articles reviews, and reports, and as a colleague, well acquainted with the routine business of this office, who could be relied on for prompt unobtrusive help in an emergency He had read widely, wrote straightforward English without frills, and was willing to take endless trouble over any editorial task that came his way It disappointed him greatly to have to decline a responsible duty for us this summer, but the severe illness for which he underwent an operation two years ago had left him in precarious health, and he would not risk 'letting the *Journal* down"

It was characteristic of Buttar that, at the age of 57, being then in the full tide of bodily and mental vigour, he decided to retire from active practice, and to seek no further office in the Association after his year as president of the Metropolitan Counties Branch He said he wished to make way for younger men before others thought the time for that had come He retained, however, his membership of the committee of the Medical Sickness and Accident Society served on the council of Epsom College and of the Fellowship of Medicine, and kept up his close association with the Harveian Society, of which he had been president and treasurer, gave time and thought to the People's League of Health, interested himself in several aspects of the tuberculosis problem and often took duty for a general practitioner friend in the country

Charles Buttar's ingrained horror of sentimentality, his caustic but suavely worded comments on the conduct of affairs, and his habit of laughing at himself and others gave him the name of cynic This was far from the truth He was a mixture of idealist and realist, holding firmly to certain basic principles which he agreed to call prejudices and tempering cool judgement and austerity of intellect with genuine kindliness In conversation and in public business he often spoke as a sceptic, but when a friend or a good cause wanted help he gave it with both hands

The funeral service on September 3rd, at Woking Crematorium, was attended by Dr Courtenay Lord, Assistant Medical Secretary on behalf of the Council of the British Medical Association, and by the Editor of the *Journal*

Mr E B TURNER, Past-Chairman of the Representative Body, and Vice-Chairman of the Central Medical War Committee, writes



By the death of Charles Buttar the Association the profession, and the country have lost an exceedingly good friend For the last twenty years of his life the honour and interests of the medical profession and of the individual practitioner were very near to his heart When the Insurance Bill was brought in he foresaw the effect that the establishment of an immense system of contract practice involving millions of the industrial classes would have on the status and position of the private family practitioner, and though thoroughly in favour of any system of insurance against sickness he was much concerned with what would most certainly be the effects of such a far-reaching change in practice He was one of those who did their utmost to fight the bill and to rally the profession as a whole to do whatsoever might in it lie to conserve the position of the family doctor acting as a private practitioner He was one of the foremost in organizing those meetings of the profession which unanimously condemned the bill and in carrying on the fight in the London district after the rest of the country had more or less accepted the inevitable Most of his predictions have been verified and he foresaw very accurately whither the outcome of such fundamental change in the relation between doctor and patient might lead He always played the game, whether to his own advantage or not When the great war broke out he was one of the foremost in attempting to organize the staffing of the new armies with civil practitioners without unduly disturbing more practices than was absolutely necessary He was one of those who, before the Conscription Act came in went about all over the country addressing meetings of doctors urging them to enrol for service in the new armies and for those who could not undertake active service to look after the practices of those who went On the establishment of the Central Medical War Committee—one of the Association's best achievements—Buttar threw himself wholeheartedly into its work and as chairman of one subcommittee almost gave up his own private work and practically lived at the office of the Association to help carry on and organize matters When medical service became compulsory he did everything possible to ensure that the case of every doctor called up who appealed should be fairly and impartially considered by the appeal subcommittees regardless of "contractual obligations" He was very active in pointing out the overlapping in the work of the medical services at the front and was one of the commission sent out by the War Office to investigate and report The report of that commission, which from start to finish bore the marks of his Roman hand was so extremely confidential that only two copies were issued—one each to the chairman and vice-chairman of the committee But many of the suggestions were carried out and bore good fruit Of apparently cynical aspect he had one of the kindest hearts imaginable, and was always ready to go out of his way to help or to do a good deed to assist anyone When hard, unpaid, and sometimes distasteful work for the profession, or the country was on hand, he was always to the fore when official recognition and rewards were about he was not

---

HERBERT WILLIAM CARSON F R C S,

Senior Surgeon Prince of Wales's General Hospital

As recorded in our last issue Mr Herbert Carson died on August 31st, at the age of 59 following an attack of postoperative pneumonia He received his medical education at St Bartholomew's Hospital, and qualified M R C S Eng and L R C P Lond in 1895 proceeding to the Fellowship of the Royal College of Surgeons of England in 1899 Early in his professional career he was elected to the surgical staff of the Prince of Wales's General Hospital at Tottenham where he was instrumental in starting the North-East London Post-Graduate College and eventually became senior surgeon He also held appointments as consulting surgeon to the Hertford County Hospital the Welwyn Cottage Hospital and the Linen and Woollen Drapers Institution and as lecturer on abdominal surgery to the North East London Post-Graduate College During the war he held a commission as honorary captain in the R A M C being surgeon to King George Hospital

Herbert Carson took an active part in the social life of the profession and was a past-president of the Medical Society of London and of the Hunterian Society he was also chairman of the executive committee of the Fellowship of Medicine with whose work he had for a number of years identified himself and recently he had become a member of the provisional organization committee for the new Post-Graduate Hospital and Medical School at Hammersmith To the British Medical Association he rendered valued service serving on the Arrangements Committee 1929-30, and but for his untimely illness and death he would have

proceeded to Canada to carry out the duties of his office as vice-president of the Section of Surgery at the recent Annual Meeting at Winnipeg Carson had every reason to look forward eagerly to this meeting, for in 1925 he had had a most cordial reception in Canada, when, on behalf of the British Medical Association, he attended the annual meeting of the Canadian Medical Association at Regina *as a very welcome guest of the latter Association* On that occasion he delivered addresses on gastric and duodenal ulcer and on cancer of the colon, and came back with a sufficient knowledge of the needs of medical men in the Dominion to help him to organize post-graduate teaching in this country on their behalf

Carson was not only admirable as a teacher on surgical subjects, but during his career he made a number of valuable contributions to surgical literature Perhaps his chief work was *Modern Operative Surgery*, for which, as editor, he wrote a large number of sections, including practically the whole of those dealing with abdominal surgery, he was also author of *Asepsis and How to Secure It* and *Aids to Surgical Diagnosis*, and editor of the tenth edition of Pye's *Surgical Handicraft* In addition to these works he made a number of contributions to the medical press, *and read numerous papers before medical societies*, included among these were "Clinical aspects of tuberculous mesenteric glands" (Medical Society's *Transactions*, vol 41) "Post-operative treatment of cancer of the breast" (*British Medical Journal*, December 11th, 1926), "Indigestion from the surgeon's standpoint" (*British Medical Journal*, March 8th, 1930)

In the sad unexpected passing of Mr Carson, the career of a brilliant surgeon has been brought to an untimely close In addition to being a man of great energy, with a tremendous capacity for hard work as a surgeon, as a teacher, as a writer, and as a speaker, he was characterized by his very infectious enthusiasm for even the smallest things in his clinical work He repeatedly emphasized the importance of the surgery of that most economic unit, the hand, and he was persistent and patient in the teaching of this subject His surgery was very good it was radical, quick, firmly yet gently performed, and the more difficult the work the more obvious became his interest, courage, and enthusiasm for it It was surprising how a man of his seniority and accomplishments kept himself quite "au fait" with the latest surgical literature, and was still writing steadily Among old students of the post-graduate college at Tottenham, many of whom are occupied in responsible posts in fields afar, his name will be kept green for many years His sterling qualities as *a surgeon and as a man, and his personal* interest in the nursing staff of the hospital, endeared him to their hearts Outside his profession, he had been a keen cricketer, a good tennis player, and played a first-class game of chess His quiet charm of manner and kindly genial disposition endeared him to a very large circle of friends Many of them gathered together at the memorial service at All Souls' Church on September 3rd, to pay tribute to him

Dr ARTHUR GILES writes:

Herbert W Carson was a man of strong personality and of great and varied abilities He was closely associated with the growth and development of the Prince of Wales's Hospital, Tottenham, which he served for about thirty-three years He *was one of the founders of the North-*East London Clinical Society and of the North-East London Post-Graduate College He was a keen and expert surgeon, and achieved a great reputation, especially in the North of London Of later years his activities spread over a wider field, and he will be remembered as a successful president of the Medical Society of London, as one of the honorary librarians of the Royal Society of Medicine, and as Hunterian Orator on the subject of the history of the knowledge of peritonitis, which attracted much attention A few years ago his reputation was greatly enhanced and extended by the publication of a new work on operative surgery which he edited, and to which he contributed valuable chapters on abdominal surgery Mr Carson was greatly interested in medical graduate study, and was one of a group of leaders of the medical profession who were in close touch with the Ministries of Health and of Education with the object of instituting an important post-graduate system in London Outside his profession he was a keen sportsman, the claims of surgery stopped his cricketing career, his special bent for wicket-keeping being too risky for surgical hands, but he was also a good tennis player and golfer Like his brother, H A H Carson, the well-known cricket expert, he was also an excellent chess player, ranking as first class in his earlier days. His death at the comparatively early age of 59 is a serious loss to the medical *profession*, and a source of profound grief to his many friends

J E MACILWAINE, M D, B Sc,

Physician to the Royal Victoria Hospital, Belfast, and formerly Professor of Materia Medica and Therapeutics in Queen's University

THE sudden death of Professor John Elder MacIlwaine, on August 13th, will long be felt as a loss, not merely by his colleagues of the Belfast Medical School, but by all his fellow workers in cardiology

Professor MacIlwaine had a full and varied life After his school days at the Royal Academical Institution, Belfast, he served an apprenticeship in his father's ship yard at Belfast, and then went to Glasgow University, where he obtained the degree of B Sc in naval architecture Shortly after his return home he became interested in medicine and entered Queen's College, Belfast, as a medical student His undergraduate career was a brilliant one, not only in the class-rooms, but in the playing fields, as well, and in the nineties, when Irish Rugby football was at its zenith, he represented his country for three years, and was one of the best of an exceptionally fine pack

The outbreak of the South African war found him a final year student, and he at once joined the Irish Hospital as a dresser, and accompanied it to the Cape, where he gained a wide experience of typhoid and dysentery On his return he graduated M B, B Ch, and B A O with honours, and then proceeded to the Continent for further study He visited Berlin and Paris and spent almost a year in Vienna He finally settled in Belfast, and became connected with the Royal Victoria Hospital, a connexion which lasted for the rest of his life He served in succession as house physician, medical registrar, medical tutor, assistant physician, physician, and consultant physician in charge of the cardiographic department During the whole term of his service his skill and knowledge, his teaching, and his advice were appreciated by colleagues and students alike

MacIlwaine's bent, strengthened by his early training, was towards practical science, and when he commenced consultant work it was inevitable that his special interest should be in the application of the physical sciences to the diagnosis and cure of disease He began by working at biochemistry, at a time when biochemistry was still in the *nature of a mystery to the practising physician* When the electrocardiograph was introduced he realized at once its possibilities, devoted himself to recording and elucidating its findings, and finally abandoned all other branches of medicine in favour of cardiology His success was complete During the great war he joined the St John's Hospital at Etaples, and took over with him his own cardiograph The results that he obtained were so accurate and so useful that in a short time he became virtually the cardiac consultant for the army in France

After the war he was appointed professor of materia medica and therapeutics in the room of Sir William Whitla at Queen's University, Belfast With characteristic energy and initiative he set to work to reorganize the curriculum and the teaching of his subjects, and he succeeded in carrying the appointment of a properly qualified professor of practical pharmacy, and in gaining the recognition of this course as an *integral part of the course of instruction* in therapeutics At the Annual Meeting of the British Medical Association in Belfast in 1909 he was joint honorary secretary of the Section of Medicine, and in 1924–25 he was president of the Ulster Branch

For some years his health had been a subject of anxiety to his friends, and about two years ago he was faced with

the threat of blindness He had always been myopic, and after some premonitory symptoms he lost completely the sight of one eye In the hope of saving the other he first resigned his professorship and then gave up his teaching work at hospital, but unfortunately all precaution was vain, and for some months before his death he was practically blind He is mourned by his wife who was for many years his constant companion and helpmate, and by many friends No one ever met MacIlwaine without being cheered and stimulated by the encounter Charmingly disputatious, kindly, reasonable, well equipped with knowledge and with the art to use it, he was an ideal companion Who that knew him can forget his mellow voice—in his younger days he was a delightful singer—and his bright laugh? Peace be to his ashes

R J J

The death of Dr W R HIGGINS of Louth, on August 22nd, has caused deep regret in Lincolnshire William Robert Higgins second son of the late Dr T J Higgins, was born in 1878 He received his medical education at the University of Cambridge and the London Hospital obtaining the diplomas M R C S L R C P in 1904 and graduating M B, B Ch Camb in the following year He proceeded M D in 1911, and became a Fellow of the Royal College of Surgeons of Edinburgh in 1918 He commenced practice in Louth in association with his father in 1904, and six years later was appointed medical officer and public vaccinator for the Welton district He was consulting surgeon to the Alford Hospital, and surgeon to the Louth and District Hospital and St Margaret's Home During the war he was attached at first to the 4th Northern General Hospital Lincoln, he then served for a time in the *Mauretania* functioning as a hospital ship, and was later with the army in France On returning to civilian life he took an active part in assisting the organization of ex-service men, and was one of the founders of the Louth United Services Club, of which he was president at the time of his death He became a member of the Louth Town Council in 1921 as the representative of the ex service men, retiring in 1926 He was also a governor of the Louth Grammar School, where as a boy he had received his early education His breezy personality, warm-hearted devotion to his patients loyalty to his colleagues and exceptional oratorical abilities made him a notable figure in Louth, both professionally and personally He was a fearless and resourceful surgeon, and his valuable work at the Louth Hospital was highly appreciated

---

Dr JOHN THOMSON WILSON, formerly medical officer of health for the county of Lanark, died on August 25th He was a native of Cambuslang, and graduated at Aberdeen University in 1891 He first assisted Professor Matthew Hay at that university and afterwards was assistant to the medical officer of health for Shropshire Practically all his professional life however, was spent in Lanarkshire but he derived his training and scientific outlook from the University of Aberdeen, which sent forth about that time a group of men who subsequently became famous in public health All these men showed that painstaking care in the application of science to health problems which characterized Wilson in the highest degree He was the second county medical officer for Lanarkshire, taking up his duties there within five years of the passing of the Local Government (Scotland) Act, 1889 at a time when county health administration was chaotic, and he laboured there for more than thirty years so as to form in that important area an effective administration for improving the public health and raising the social standards of the people In this he did most notable work, and only those who knew the conditions in Lanarkshire in the nineties are able to form a just opinion of the magnitude of the task which he faced Water supply and sanitation in these villages and busy industrial towns were wanting or primitive to a degree The rich mineral wealth of the county attracted immigrants from all parts of Great Britain and Ireland giving rise in many areas to grave overcrowding and increasing the effects of bad sanitation In dealing with these Dr Wilson showed not only clear judgement, but unswerving determination to improve the conditions of the inhabitants In these days of advancement and progress in public health matters it is pleasing to have to record of one of the most progressive of medical officers of health that with him environment and general health considerations had always the first place He did not believe that *ad hoc* effort could ever correct faulty health conditions but, nevertheless, all special departments in public health work had his enthusiastic support The bacteriological laboratory, the chemical laboratory and the hospital arrangements of Lanarkshire under his inspiration became foremost throughout Scotland while the tuberculosis and venereal schemes and the child welfare arrangements of that county were all well thought out and models of their kind Dr Wilson was gifted not only with a sound scientific knowledge of disease and health conditions but also with much business acumen and common sense upon which he relied in dealing with his many committees and councils He was something more than a mere medical man or medical officer of health—he was a practical man of the world who appreciated practical difficulties and envisaged problems as they appeared to councillors and public representatives On that account he was singularly successful and happy in his relationship with his councils who ever placed in him their confidence and respect Dr Wilson's influence in public health extended far beyond Lanarkshire A generation of medical officers of health, working in England Scotland and the Colonies owe to him their first inspiration in public health and many of the advances made in the past thirty years elsewhere have been almost directly due to that quiet self-contained, patient, and high-minded chief whom all his assistants revered His passing leaves a blank with many but his example lives

---

Dr HUGH COLLIGAN DONALD, T D, who died at Paisley on August 20th, aged 60, was the third son of the late Dr J T Donald a former Paisley medical officer He was educated at Paisley Grammar School, Merchiston and Glasgow where he graduated M B C M in 1891 Six years later he obtained the diploma F R C S Ed and was appointed surgeon to the Royal Alexandra Infirmary Paisley a position from which he retired only this year He was also consulting surgeon to the Royal Victoria Eye Infirmary a certifying medical officer for mental disease and lunacy and specialist in venereal diseases to the Paisley and Greenock corporations At the outbreak of the South African war he became a medical officer to the 3rd British Cavalry Brigade, and he received the Queen's medal with four clasps In 1914 he acted as senior medical officer to the Argyll and Sutherland Brigade (Territorial) with the rank of major in the R A M C subsequently serving in other capacities and retiring with the rank of lieutenant-colonel He was a member of the British Medical Association

NORTH PERSIAN FORCES MEMORIAL MEDAL

THE War Office announces that Captain H W Mulligan M B Indian Medical Service has been awarded the North Persian Forces Memorial Medal for the year 1929 for his paper reference to malaria published in the *Indian Journal of Medical Research* vol xvi No 4 April 1929 This medal is awarded annually for the best paper on tropical medicine or hygiene published in any journal during the preceding twelve months by a medical officer of under twelve years service of the Royal Navy Royal Army Medical Corps Royal Air Force Indian Medical Service or of the Colonial Medical Service provided the Memorial Committee considers that any of the papers published has attained a standard of merit justifying an award.

Universities and Colleges

UNIVERSITY OF CAMBRIDGE.

DR. H. W FLOREY of Gonville and Caius College has been reappointed Huddersfield lecturer in special pathology G L. Taylor M D., of The following elections are announced the John Lucas Walker studentship for three years A Brauch, M.D to the Gwynaeth Pretty studentship for three years.

Medical News.

THE annual exhibition of the Royal Photographic Society of Great Britain opened on September 11th at 35, Russell Square, W C 1, and will continue until October 11th Among the exhibits are photomicrographs illustrating the structure of emulsions, studies of the effect of recoil in revolver shooting and of shotgun bursts due to obstruction, radiographs showing structure differentiation, and colour transparency views of Indian subjects

AT the provincial meeting of the Society of Medical Officers of Health to be held at Lowestoft on September 19th and 20th the members will be entertained by the Mayor and Corporation of Lowestoft at luncheon at 12 30 on September 20th and not on September 19th as stated in our previous notice

THE Committee for the Study of Medical Hydrology is arranging its programme for the coming winter The object of the committee is to supply lecturers on the subjects of spa treatment and general medical hydrology for medical societies and for medical schools where these subjects are not already included in the curriculum A list of the lecturers available will be forwarded on application to Dr Geoffrey Holmes, 11, Ripon Road, Harrogate

THE annual meeting of the International Society of Medical Hydrology will be held this year in Lisbon and the Portuguese spas, from October 15th to 23rd, in conjunction with the Congrès International d'Hydrologie One medical discussion is being arranged by the society, on the treatment of digestive disorders by waters and baths General meetings will also be held to consider a system for the international registration and classification of waters, the organization of health resorts for insured workers (social hydrology), and proposals for the protection of the names of the spas Papers are read in English, French, or German, and translations supplied The Portuguese spas to be visited include Coimbra, Curia, Oporto, Bussaco, and Vidago The annual meeting will also include social events, a banquet in Lisbon, and reception by the President of the Republic The meeting is open to non members, at a fee of 10s (and 5s for a lady accompanying a participant) Expenses in Portugal are £10 3s 6d, and the fare from London to Lisbon and back in ss *Cap Arcona* from Boulogne on October 11th is £19 0s 6d Alternative travel overland can be arranged A limited number of medical practitioners and students who are interested in hydrology are invited to take part in this meeting Applications should be received at the office of the society, 55, Wellington Road, N W.8, not later than September 15th

A MEETING of the Royal Sanitary Institute will be held on Saturday, October 4th, in the Town Hall, Hereford The subjects for discussion will be the place of women in local government, the preservation of the countryside, and the health authority and the milk supply The chair will be taken at 10 a m by Dr George F Buchan

THE German Society for Industrial Hygiene will hold a congress at Breslau from September 22nd to 24th, papers will be read on work and housing by Professor von Drigalski of Berlin and on hygiene in the office by Dr Holstein of Frankfort on the Oder and Dr Kremer of Berlin.

THE recent meeting of the International Society of Microbiology in Paris was attended by more than 700 members The three sections—general and medical microbiology, serology and immunity, and agricultural microbiology—had daily sessions at the Pasteur Institute Professor Ledingham and Dr Arkwright were the only English "rapporteurs," and dealt with variation amongst bacteria, Sir Almroth Wright demonstrated bacteriological technique Numerous papers on the relation of lipoids to immunity, neurotrophic viruses, yellow fever, blood groups, undulant fever, influenza, scarlet fever and diphtheria, bartonellosis and syphilis, reviewed the present knowledge of these fields of study, the detailed papers will be published later The exhibition of some excellent films of the developmental cycle of various parasitic worms and the splitting of bacilli attracted a large audience Professor Bordet, the president, announced at the final meeting that the next congress would take place in Berlin in 1933 The banquet on the last evening was so popular that the restaurant originally chosen could not accommodate the diners The speeches reflected the spirit of real international amity, which was an especially pleasing feature of the whole congress

THE last annual report of the Board of Control states that on January 1st, 1930, the number of notified insane persons under care in England and Wales was 142,387, an increase of 1,307 during the preceding year, the average annual increase for the five years ending January 1st, 1930, being 2,167 The percentage distribution of the sexes—males 44 2, females 55 8—showed an increase of 0 3 in the proportion of males Deaths numbered 9,739 (males 4,539, females 5,260) They were 1,030 more than in the preceding year. The number of certified mental defectives in institutions on January 1st, 1930, was 23,485 In addition, there were 2,212 defectives in institutions and homes who were not certified, making a total of 25,697

KING'S College Hospital Medical School has now entered upon its centenary year, and an account of the work accomplished during the past 100 years will be given by Dr Raymond Crawfurd on October 1st at the opening ceremony of the winter session, presided over by Dr G F Still The centenary dinner, under the chairmanship of Sir StClair Thomson, will be held on the evening of the same day at the Connaught Rooms The medical school needs urgently the completion of its buildings, the erection of half of which was prevented by the outbreak of the war It is proposed to mark the centenary by carrying out this work as soon as funds are available, and for this purpose money is being collected

AT the recent Empire Conference of the British Red Cross Society a resolution was passed approving the principle of reading as part of curative medicine, and desiring to see it established in all hospitals in due course In this connexion it is of interest to note that the subject of hospital libraries will be discussed at the Conference of the Library Association to be held this month in Cambridge. On Tuesday, September 23rd, at 2 15 p m, there will be a short paper on the history and practice of this work as done in Great Britain, Miss Ostenfeld, organizer of the Hospital Library Service at Odense, will speak on collaboration between public libraries and hospitals in Denmark, and Miss Perrie Jones, hospital librarian, Public Library, St Paul's, Minnesota, on the psychological value to patients of hospital libraries Representatives from institutions are invited to write for further details to the secretary, Library Association, 76, Bedford Square, W C 1

THE system of compulsory notification of acute rheumatism which was instituted in the Royal Borough of Kensington in October, 1927, for an experimental period of three years, will be continued for another period of three years, dating from October 1st, 1930 It has been decided that the expression "acute rheumatism" shall be interpreted to mean the following conditions, occurring separately or together in a child under the age of 16 years (1) rheumatic pains or arthritis, if accompanied by a rise of temperature, (2) rheumatic chorea, (3) rheumatic carditis Complete details are embodied in Statutory Rules and Orders, 1930, No 659, published by His Majesty's Stationery Office, price 1d

A MEMORIAL window to the late Dr John K Stewart was recently unveiled by his son in the Randalstown Presbyterian Church, County Antrim Dr Stewart died on April 15th, 1923, at the age of 29, as a result of wounds received on active service An obituary notice appeared in the *Journal* of May 5th, 1923 (p. 792)

MEMBERSHIP of the Guild of St Luke is open to all students and practitioners of medicine—both men and women—who are members of the Church of England, the clergy of which are eligible as clerical associates The Guild was started in London by a few medical students over sixty years ago, and there are also now in London a Women's Ward and a Students' Branch, as well as a Midland Counties Ward and a Cambridge Ward The Chapter of the Guild meets in each month of the academic year, and a festival service is held annually at St Luke's Tide, either at St Paul's or Westminster Abbey This year the service will be at St Paul's Particulars of the objects and activities of the Guild and forms of application for membership can be obtained from the secretary of the Guild of St Luke, King's College, Strand, W C 2.

ACCORDING to the *Journal of the American Medical Association*, "Typhoid Mary," the carrier who infected at least twenty eight members of seven different families in which she was employed as cook, is still alive and is quarantined in a New York hospital, where she earns a small salary by cleaning glassware Her stools are constantly used by the New York Department of Health as a control for bacteriological media

THE August issue of the *China Medical Journal*, which periodical is published monthly by the China Medical Association, takes the form of a special leprosy number Original articles and reports on the progress being made by leprosy institutions depict the outlook as regards the treatment of this disease in China at the present time, and Dr J L Maxwell summarizes the salient points in this respect The clinical side of the problem is discussed by Dr Ernest Muir, Dr A J Watson, and others

THE issue of the *Paris Medical* dated August 16th is dedicated to the memory of Jules Marey on the occasion of the centenary of his birth, and contains the address delivered by Professor Richet to which we alluded in the *Journal* of August 16th (p 271). Marey, who was for thirty five years professor at the College de France, was

not only the first to introduce the graphic method into physiology and the sphygmograph into clinical medicine, but by his study of simple and complicated muscular movements, and of the flight of birds and insects he was one of the precursors of cinematography and aviation In addition to publishing the commemorative orations delivered by Professor Richet of the Academie de Medecine Professor Glev of the College de France and M Raoul Grimoin Sansom, director of the Marey Institute in the Bois de Boulogne the issue of the *Paris Medical* contains extracts from Marey s works on the circulation of the blood human movements, and the flight of birds and insects

PROFESSOR SIGMUND FREUD of Vienna has been awarded the Goethe prize of 10 000 marl s

THE one hundred and sixtieth volume of the *Archiv für Klinische Chirurgie*, the two hundred and twenty fifth volume of the *Deutsche Zeitschrift für Chirurgie* and the issue of *Wiener medizinische Wochenschrift* for August 9th have each been dedicated to Professor Anton von Eiselsberg of Vienna on the occasion of his 70 h birthday

THE *Gazette des Hôpitaux* for July 30th contains a facsimile of the greatly abridged issue of August 1st 1830 when *La Lanccttc Française* as the journal was then called was suspended by royal decree in common with the rest of the periodical French press

WE have received the first issue, published last January at Naples, of *Diagnostica e technica di Laboratorio* a monthly journal edited by Professors L D Amato of Naples and L Zoja of Milan supported by an international committee The issue contains original articles dealing with laboratory diagnosis and technique short laboratory notes reviews of books and abstracts from current literature The annual subscription is 120 lire for Italy, and 150 lire for foreign countries

MR LEONARD L MACKALL, a well known figure in Osler s wor d has been appointed consultant in bibliography to the New York Academy of Medicine

DR. JOHN WILLIAM HUNT, acting chief medical officer has been appointed a nominated member of the Legislative Council of the Colony of I iji

MESSRS CASSELL AND CO , LTD announce for early publica tion *Sick Children Diagnosis and Treatment* by Dr Donald Paterson also a fifth edition of Treves s *Students Handbook of Surgical Operations* revised by Mr Cecil Wakeley

"DI VON " invites suggestions for treatment other than rest for wri er s cramp? "Is electrical treatment of any value and what is the prognosis?"

PYLORIC CANCER REMISSION OF SYMPTOMS

"WICKLOW" writes On March 5 h last a patient of mine was discharged from a Dublin hospital w th pyloric cancer too advanced and himself in too bad a bodily state for operation He came home to die and now six months later he is doing casual work on a farm Some three months ago he commenced to take cod liver oil daily in good doses and declares he improve l from the day he began it Has any reader had a similar expe rience? The man was carefully x rayed and examined in every possible way in the Dublin hospital

PROLONGED ADMINISTRATION OF SALICYLATES

"M D " writes Can any pharmacologist tell me whether prolonged taking of sodium salicylate for chronic rheumatism is likely to be a factor in the deposition of oxalates forming oxalate renal calculi?

WHITE SPOTS ON FINGER NAILS

"R L " asks for information about the nature and treatment of the white spots which occur on finger nails He writes Sir Norman Walker I believe stated that they were due to air in the nail cells A patient whose nails are very unsightly through these spots plays a lot of golf and tennis

TREATMENT OF DYSMENORRHOEA

DR FRANCISCO PINTO (Barcelona), in reply to Dr F R B Murray s inquiry (August 16th p 372 writes I would suggest injections of alcohol into the perineurine ganglion of Franken haeuser as described by Dr Dietrich Blos in the *Münchener medizinische Wochenschrift* of July 12th 1929 (p 1173)

KEEPING FIT IN HOT CLIMATES

SURGEON COMMANDER A BERNARD CLARE R N writes Having spent four ont of the past eight years on the Mediterranean station I would like to reply as follows to the inquiry of C H B Alcohol is not at all essential to health and I am convinced that one is better without it in hot climates I am an abstainer myself and have never had one day s real sickness It is quite erroneous to say that total abstainers are the first men to go sick actually they are probably the last I agree that pro tection of the abdomen especially at night is very important there can be no doubt that a large number of cases of enteritis are caused by neglect of this precaution Anyone who takes large quantities of alcohol must undoubtedly take a large amount of violent exercise to get rid of the poison and so keep fit but one who abstains can get all the exercise he requires during the very hot weather in frequent bathing and swimming There is no doubt that exercise of some kind is essential for complete fitness even in the hottest weather

"C G H " replying to the inquiry of "C H B "(July 26th p 168) writes Ten years practice in the Tropics has convinced me that the problems of exercise and alcohol there are exactly paralleled by those in temperate climates the individual varying in his requirements in both respects Thus the "beefy active he man " who has usually a large appetite requires a consider able amount of exercise The type which may be broadly called the " vagotonic " also seems to need alcohol as a sedative without which he will react too readily to the many minor irritations characterizing life in a hot climate becoming irritable and sleeping badly The opposite type however the spare man of moderate habit and physique (broadly the sympathicotonic) can I am sure do with far less of either and will be the worse for trying to compete with those otherwise constituted Too frequently there are to be seen cases of exercise pursued to exhaustion and followed by the attempt to repair that exhaustion with an extra ration of alcohol It is often forgotten that mere existence in a hot climate entails more output of energy both bodily and nervous than residence in a cool one this should be taken into account by the individual (or his medical adviser) in working out his needs in the way of exercise and alcohol The latter is in my opinion of great use as a sedative but should be employed strictly as such—for instance at the end of a trying day to damp down the worries and irritations of work and facilitate the transition to the evening s recreation If a man always has a "sundowner " however he will need two when the weather is bad or his job is particularly trying and the step from this to the daily " two pins " is a short and easy one Alcohol with the day s work ahead is anathema and the royal road to a heat stroke

DERMATITIS HERPETIFORMIS

"M B " (Northampton) writes In reply to Dr Richmond s inquiry (August 23rd p 308 I have always thought that arsenic was considered the only remedy for dermatitis herpet formis I have had two cases—one nearly fatal in a very old lady—and I by pushing arsenic to extreme doses brought about their recovery

SOUR MILK.

DR. M R SONI (Manchester) replying to "E W D "(August 9 h p 236) writes I recommend as the best and cheapest meth l of preparing sour milk the following proce lure which is adopted in India Boil the milk and when it has cooled down to about 100° F pour it into a flat basin adding two tablespoonfuls of "dahi " which can be obtained from most Indian restaurants. Stir well and allow to stand for seven to ten hours in a moder ately warm oven At the end of this period the milk will have set " All the sour milk is used except a few tablespoonfuls which should be added to fresh milk on the following day the process can be continued indefinitely A little practice will improve the results to a great extent. If the milk has a sweet

it has not "set" properly If it tastes too sour, too much "dahl" was added to the boiled milk, or the milk was allowed to stand unduly long Excessive heating will stop the fermentation process, too much cold will retard it

INCOME TAX

Expenses of Supplementary Practice

"H M G" holds a hospital appointment, and is permitted to do private work The latter necessitates using his residence and car for professional purposes, and he is unable to agree on the appropriate deductions with the local Inspector of Taxes

*** The fact that the car was necessitated by the private work, and might otherwise not have been acquired, does not provide a good ground for claiming to deduct a higher ratio of the car expenses than that indicated by the professional and private mileages That ratio would apply also to the chauffeur gardener's wages, after excluding the gardening time as purely personal With regard to the rent, rates, and other general household expenses, much would depend on which room is set aside for professional purposes, and the extent to which it is put to private uses Perhaps the analogy of the clergyman's study, for which he is allowed one eighth of the total cost, points to the proper ratio

Expenses of Locumtenent and Car

"REVENUE" inquires what is a proper amount to deduct for board and lodging for a locumtenent, and also what is the basis for dividing motor car costs between professional and private use

*** Our correspondent has presumably already deducted some part of the general domestic staff expenses and a percentage of rent, rates, etc, as applicable to professional purposes, and it has to be remembered that it is only the balance of these expenses from which an allocation for the board and lodging of the locumtenent can be made So much depends on circumstances that it is difficult to advise, but 4 guineas per week seems high for a normal provincial practice The only definite and satisfactory basis of allocating car expenses is the mileage basis, and for that reason it is advisable to keep a record of private mileage

LETTERS NOTES ETC

SPIROCHAETES IN HODGKIN'S DISEASE

DR P F MACGINNIS (pathologist to the Chesterfield and North Derbyshire Royal Hospital) writes. We have found a large spirochaete in the cervical glands of two consecutive cases of Hodgkin's disease, and we believe this to be an etiological factor in the disease Should any readers happen on any freshly excised glands from a case of this disease we should be glad to have a fragment sent in 10 per cent formalin solution A detailed account of the facts will be published at a later date

ANHYDROSIS AND ABSCESS

DR R JOHNSTON MCNAB (Manchester) writes I have recently seen two cases of axillary adenitis in ladies, both of whom I have examined carefully for any septic abrasion or cut in the skin, but in both cases I have failed to find any On questioning these patients I have elicited the fact that some weeks before the onset they had used a toilet preparation which claims to check perspiration from the part to which it is applied, and it evidently succeeds In the first case several glands in the axilla broke down and had to be excised In the second case only one gland appears to be infected—a hard, nodular mass about the size of a cherry just below the anterior axillary fold I should be glad to hear if any other readers have had any similar experience

TREATMENT OF ACUTE LYMPHATIC LEUKAEMIA

DR A H MUIR (Halifax) writes Dr Raymond Pearce has kindly thanked me in reporting his case of acute lymphocytic leukaemia (August 23rd, p 282) When invited to see the child in my opinion both liver and spleen were enlarged Taking the idea that the liver and spleen were not functioning, I elaborated the treatment which, as far as I know, is quite original In pneumonia liver extract is very useful Spleen solution sometimes gives a powerful reaction, at most pyrogenetic

THE CONDUCT OF NORMAL LABOUR.

DR W G F OWEN MORRIS (Dedham, Essex), in the course of a letter expressing approval of the effort to supply anaesthesia for childbirth in necessitous cases, writes I consider that in all cases where a doctor is in attendance a general anaesthetic and instruments should be employed because of the risk of torn cervix, of torn perineum, of sepsis, and of damage to the child It is not the use but the misuse of instruments which causes any of these troubles, such misuse is fundamentally due to bad and inadequate training of the young doctor Since beginning this practice I have never conducted a confinement without the use of chloroform and instruments and I can conscientiously say that there has been no permanent damage to mother or child in any of my normal cases I feel that the immediate oblivion granted to the patient and the awakening to find the child all pain having ceased, has been full justification for these methods

"PRONE" OR "SUPINE"

"MEDICUS RESUPINATUS" writes In the *Journal* of July 26th (p 161) there is some discussion anent the correct position of the patient whose varicose veins are about to be injected One author, we are told, declares that the ideal position of the patient is "prone" upon a couch, while another maintains that the patient should always be recumbent We are, of course, all of us prone to error, but I do not know that we should, suppose, allow error to be perpetuated Now what did Macaulay write, a hundred years ago, about the poet who described the "prone soldier" as "staring ghastly at the skies"?

TSETSE RESEARCH IN TANGANYIKA

HIS MAJESTY'S Eastern African Dependencies Trade and the following unofficial information for the month of June, 1930

(1) At Kikoro Entomological Station the programme of investigation into the behaviour of tsetse in relation to season, game, and vegetation was continued The data agreed in general with those of the same period of the previous year, but the numbers of fly were extremely low, possibly owing to the phenomenal rains (2) At Kikoro Ecological Station the intensive study of tsetse in relation to its environment has been continued Attention is being paid to a fungus which has appeared on the tsetse, and intensive study of puparia has been commenced (3) The experimental formation of vegetation barriers to tsetse at Itundwe Planting Station received considerable attention The sowings and plantings of last season are already giving indications as to species likely to be of use A new nursery was formed, as the existing nursery was found to be insufficient Experiments in working cattle in a fly area are in progress on this station in conjunction with the veterinary department (4) The poisoning of vegetation has been at a standstill since May, owing to the absence of the officer in charge of this work on vacation leave. It is intended to resume this work in full force on his return in October Meanwhile, the past work is being kept under observation

STANDARD INDEXING

SIR J J THOMSON, O M, President of the Association of Special [illegible] writes An immense volume [illegible] ing recorded in every intellectual field, to render it universally available a system of indexing applicable to all purposes and in all countries is essential The international adoption of a standard system of indexing would enable references to information on any subject, whatever their source, to be brought into their correct places in a bibliography This would tend to the preservation and freer exchange of knowledge The universal decimal classification of the Institut International de Bibliographie has proved to be a suitable system for [illegible] and is already widely used A joint committee of Special Libraries and Information Bureaux (on Frederic Nathan and Lieut Colonel L Newcombe, National Central Library) and the British Society for International Bibliography (Dr S C Bradford, Science Library, and Professor A F C Pollard, president, Institut International de Bibliographie) has now been formed to advise and assist in its adoption and use in this country Anyone interested is invited to communicate with the Association of Special Libraries and Information Bureaux, 26, Bedford Square, London, W C 1

TESTIMONIAL TO SIR RONALD ROSS

WE printed on May 10th (p 892) a list of donations received during February, March, and April, in response to the appeal on behalf of the Ross Award Fund Further contributions have been made between May 1st and August 26th as follows the Government of Cyprus (£200), the Maharajah of Mysore the Oriental Telephone and Electric Co, Ltd, the Chamber of Mines staff of the Nigerian Council, Miss Lindsay, Miss Mary Barclay, Miss J Stark Browne, Mr Edmund da Costa, Mrs E L Charrington, Miss L Carter, Miss H S Cooper, Mrs Elliott Dr J H Gibbon, Miss Giles, Miss A. Giles, Professor Umberto Gabbi, Mrs S B Gorst, Mr Fry, Mr T M F Janssens Miss A A Parson, Miss. M Reddan, Mrs Scolios, Mrs Kate I Swan, and Mrs M F Thomson, the total amounting to £435 18s 7d The sum so far received was £14,111 18s 6d on August 26th Donations to the Fund should be sent to Lloyds Bank, Ltd, 110, High Street, Putney, S W 15

MEDICAL SERVICES IN MALAYA.

Correction

WE hasten to correct a misprint which occurred in the Educational Number of the *British Medical Journal* (September 6th, p 401) The second paragraph of the section headed "Medical Services in Malaya" opened with a statement that 'The climate of Malaya is, for the Tropics, very unhealthy This, as the context plainly shows, ought to read ' . . very healthy"

VACANCIES

NOTIFICATIONS of offices vacant in universities, medical colleges and of vacant resident and other appointments at hospitals will be found at pages 39, 40 42, 43, 44, 45, 49 and 50 of our advertisement columns, and advertisements as to partnerships assistantships, and locumtenencies at pages 46 47, and 48

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page 131

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

223. Acute Benign Idiopathic Serous Meningitis

S ANDERSEN and F WULFF (*Ugeskrift for Laeger* June 12th 1930 p 572) record their observations of 35 cases of acute benign idiopathic serous meningitis admitted to fever hospitals in Copenhagen during the period 1917–28 Inquiries were made in 1929 as to the subsequent fates of these patients and all but five were traced In 2 of the 30 known cases it was ascertained that signs of chronic encephalitis had subsequently developed in the remaining 28 cases the complete recovery observed at the time of discharge had been maintained except for some passing troubles in a few cases All the patients were young the oldest being only 32 there were 24 males and 11 females The onset of the symptoms was abrupt, but not particularly characteristic One or more of the following manifestations were common malaise, fever shivering vomiting, headache mental confusion and sore throat After an interval ranging from hours to days, these prodromal symptoms were followed by meningeal signs which were often well developed There was cervical rigidity with kernig s and Brudzinski s signs cutaneous hyperaesthesia dermographia, restlessness, partial loss of consciousness, and sometimes, convulsions Patients with well defined focal signs such as ocular manifestations were not included in this series but were grouped as cases of encephalitis The changes in the cerebro-spinal fluid were the most important from the diagnostic point of view It was clear or almost clear and the greatest number of cells counted was 1 033 From this figure down to the normal number of cells there was an even decline In as many as 27 cases lymphocytes were found alone or in an overwhelming majority In spite of the alarming character of the early symptoms the subsequent course of the disease was comparatively benign, the temperature falling by lysis in three to thirteen days and its average duration being about a week The other manifestations disappeared simultaneously, and convalescence lasted two to three weeks The headache was in most cases the last symptom to disappear In two cases the patients had been vaccinated a fortnight before the onset of symptoms The distribution of the cases in the period under review was uneven their incidence showed a marked increase since 1920 This observation suggests that these cases may have something to do with epidemic encephalitis, the incidence of which has also showed a marked rise in Denmark since 1920 In other words acute benign idiopathic serous meningitis may be a meningeal localization of the virus of epidemic encephalitis This is the view to which the author inclines but he notes that there is a possibility of these cases belonging to a disease *sui generis* the virus of which has not yet been identified

224. The Electrocardiogram in Artificial Pneumothorax.

P PERRIN and P DROUET (*Arch des Mal du Cœur* June, 1930 p 387) have studied the influence of artificial pneumothorax upon the electrocardiogram They remark that earlier observations on the electrocardiographic changes due to pleural effusion are in many cases open to interpretation on the basis of myocardial damage this study has therefore been confined to patients whose general and cardiac conditions were very good The series consisted of sixteen patients with right sided and thirteen patients with left sided pneumothorax and one patient had had both lungs collapsed In each case orthodiagrams and electrocardiograms were taken before and after refills of 800 to 1 000 c cm All the electrocardiograms were found to be of the type characteristic of the "vertical heart In a large percentage the voltage of R in Lead I was diminished while that of R in Lead III was increased This alteration corresponds with a deflection of the axis of the heart into a more vertical position it occurs equally with right and left sided pneumothoraces since in either case the heart becomes more vertical owing to the bilateral depression of the diaphragm which is brought about Electrocardiography showed right ventricular preponderance in half the cases of right pneumothorax, but the introduction of air into the left pleural cavity did not commonly produce left sided preponderance The authors conclude that pneumothorax produces certain physiological modifications in the electrocardiogram and that other changes ordinarily represenin, myocardial defect are not produced by pneumothorax or pleural effusion

225 Malignant Hypertension.

RECENT worl has emphasized the importance of a group of rapidly fatal cases associated with excessive hypertension a condition which has been specified by various terms such as malignant hypertension and malignant renal sclerosis of Fahr I D MURPHY and J GRILL (*Arch Int Med*, July 1930 p 75) review the literature on this subject and record an analysis of 16 cases of malignant hypertension Of these, 13 patients died and 12 post mortem operations were performed Clinically the chief symptoms were headache very marked loss of weight constant cardiac hypertrophy persistent excessive hypertension the functional failure of one or more essential organs a progressively downward course and a rapid termination A characteristic retinopathy was present in all cases Histologically the essential lesions were arterio-sclerotic the smallest arteries and arterioles being almost invariably involved In 6 cases necrotic lesions had developed in the walls of the afferent glomerular arterioles and in the loops of the corresponding glomerull Hypertrophy of the media of the arterioles of the skeletal muscles was usually found to be present In the arterioles of the kidneys and other organs hypertrophy of the tunica media was occasionally noted in association with sclerotic changes The clinical and morphological observations relating to malignant hypertension differ only in degree from those of hypertension of a benign type Greater severity of the clinical symptoms and a more extensive and destructive form of lesion of the smallest arteries and arterioles are characteristic of the malignant condition

226 Jaundice in Syphilis.

C GJESSING (*Norsk Mag f Laegevid*, July, 1930 p 716) records 9 cases of jaundice which occurred among the male syphilitic patients at the Ulleral Hospital in the period 1922 30 It appeared in 3 at the beginning of treatment by salvarsan, in 4 during its course and in 2 after the treatment had ended Gjessing maintains that most of the cases of jaundice occurring in the course of salvarsan treatment are of an infective nature, because an increased frequency of jaundice among syphilitic patients is accompanied by a rise in the incidence of jaundice in the rest of the population In some cases however, it may be difficult to determine the cause of the jaundice In Gjessing s three cases in which it occurred at the beginning of treatment the jaundice was regarded as syphilitic principally because it was associated with other syphilitic symptoms, and was therefore treated with neosalvarsan The disappearance of jaundice however, under treatment by salvarsan is no proof that the jaundice is syphilitic, since it may disappear without specific treatment, and there is always the possibility that a number of microorganisms which produce jaundice besides that of syphilis, are affected by salvarsan Although Gjessing has treated cases of jaundice in syphilis by arsenobenzol preparations without complications, he considers it advisable in view of the fatal cases on record to stop the specific treatment on the appearance of jaundice and to resume it only when the jaundice has disappeared

227 Immunization against Scarlet Fever

AN extensive epidemic of scarlet fever in an institution for children allowed SCHOTTMÜLLER (*Deut med Woch* July 11th 1930 p 1159) the opportunity of testing the value of prophylactic immunization on a large scale The first child developed scarlet fever four days after admission and after an interval of four days new cases occurred at the rate of two or three daily so that after three weeks there were 31 cases in the home Since passive immunity though immediate in its action lasts only a week or two while active immunity is not effective for the first few weeks a combination of the two methods was tried 175 children being inoculated with 10 c cm of immune serum and 1 c cm of the ' Gabritschewsky toxin second and third injections of toxin only were given later Two further cases occurred the patients being children who had not been inoculated since they were said to have had scarlet fever All the remaining children were therefore injected After eighteen days three more cases occurred— hat is just at the time when the passive immunity would be almost exhausted The remaining children were therefore given a second dose of serum and no further case occurred The author adds that no serious after-effects of inoculation were observed the Dick reaction proved to be positive in 87 per cent of the children before treatment, and in 35 per cent afterwards

228 Complete Heart-block of Long Duration

D PACI (*Rinascenza Med*, May 1st, 1930, p 219) reports a case of heart-block in a man aged 49, and first noticed at the age of 14 The patient had had diphtheria with bulbar symptoms and paralysis of the lower limbs at the age of 2, scarlet fever and typhoid at 14, severe acute rheumatism at 17, and a septicaemic form of influenza during the epidemic of 1918 In the Messina earthquake the patient remained buried for seven hours under the debris and was rescued after severe suffering He had never had vertigo, dyspnoea, or syncopal or epileptiform attacks, and the only noticeable sign in the heart was its slowness of beat, there being long pauses and occasionally an additional tone The pulse was 44, but was otherwise normal even after muscular exertion Electrocardiographic examination revealed complete heart block and electrical signs of myocardial insufficiency The author doubts whether the heart block was a result of the diphtheria or was congenital The literature records only six cases of this kind, this seventh case holding the record as regards duration, it is further distinguished by the complete absence of clinical symptoms Pace thinks this chronic and benign type of heart block should be distinguished from the true form of Stokes Adams syndrome, further research is necessary to elucidate its nature and pathogenesis

229 Recurrent Agranulocytosis

B H RUTLEDGE, O C HANSEN-PRUSS, and W S THAYER (*Bull Johns Hopkins Hosp*, June, 1930, p 369) record a unique case of cyclic agranulocytic angina, associated with fever and constitutional symptoms but without anaemia, beginning at the age of 2½ months and recurring at intervals of approximately three weeks during the entire life of a man aged 20 years The outstanding and commonest symptoms during an attack were a sore mouth with swelling and reddening of the gums, and shallow ulcerations and induration of the gums, lips, tongue, and buccal mucous membrane, associated with a moderate degree of regional adenitis Vincent's organisms were obtained from these sites in large numbers The only abnormal physical manifestation observed between the attacks was the chronic infection of the gums Treatment of the infection of the mouth resulted in disappearance of the excess of Vincent's organisms in the intervals, but did not affect the periodical recurrence of fever and agranulocytosis, nor of the stomatitis which reappeared with them Between the attacks the patient seemed to be in good health, and the blood showed no abnormalities apart from the sluggish granulocytes

Surgery.

230 Thyroglossal Cysts and Sinuses.

WITH normal development the thyroglossal tract becomes completely obliterated before birth, when a portion of this tract persists, it may occasionally give rise to a cyst or sinus, and, rarely, to a congenital fistula Aberrant locations of the thyroid gland may also result from arrest in its development Very rarely, malignant tumours may originate from the epithelium of the tract H M CLUTE and R B CATTELL (*Annals of Surgery*, July, 1930, p 57) record a study of 58 cases of thyroglossal anomalies which have been watched for more than a year after the operation The rarest anomaly associated with the tract is failure of the thyroid gland to descend into the neck, it may not leave its point of origin in the pharynx, and may persist at the base of the tongue as a lingual thyroid gland The most common abnormality in the tract is a simple cyst or sinus, and its incidence in female patients was nearly twice that in males, the average age of the patients was 33 years Only eight of the cases were discovered before the age of 10 years, this abnormality, therefore, was usually found in adult life The cyst contents are generally of a mucoid character, but in long standing cases may consist of necrotic material and cholesterin crystals When infection is present the contents are purulent, and in old cases the cyst wall is thickened by repeated inflammatory changes The most common location of these cysts is in the mid line of the neck on the thyrohyoid membrane, lying in the subhyoid area The subjective symptoms are almost entirely related to the presence or absence of infection The mid line position of a thyroglossal cyst, its intimate relation with the hyoid bone, and its upward movement on deglutition render its diagnosis very simple Operation may be advisable for unsightliness, a discharging sinus, and infection Incision and drainage should be performed only if acute infection is present, a radical operation is necessary to ensure cure. The authors' method consists in complete removal of the cyst or sinus, resection of the median portion of the hyoid bone, and excision of a core of muscular tissue in the plane of the tract up to the foramen caecum The end results have been most satisfactory, there was no operative mortality, and no recurrences have been recorded

231 After-treatment of the Simple Mastoid Operation

E R ROBERTS (*Arch of Otolaryngol*, May, 1930, p 583) reviews the methods in common use in the treatment of mastoid wounds The complete removal of all necrotic bone and the opening of all cell galleries is, of course, a necessary preliminary to any successful treatment Complete closure of the wound, the so called blood clot method, is described as unsafe and unsurgical Excellent results are obtained by leaving the wound widely open and packing with gauze soaked in chlorinated soda solution, enabling healing by granulation to take place from the bottom Although this method produces a sound scar, it is very long, tedious, and obviously unpractical for routine use in private practice Roberts's method is based on the principle of the after treatment of accessory sinus operations—namely, by providing for aeration and drainage At the operation the cavity is packed with iodoform gauze, and the wound is closed, except at its lower end, with silkworm gut sutures and clips alternating The primary dressing and the sutures are removed on the fourth day A fenestrated rubber drainage tube is then introduced into the wound down to the antrum, and is fixed in position by means of a perforated piece of gauze and a liquid adhesive preparation The tube is passed through a hole in the gauze, and the gauze is fixed to the skin by adhesive plaster No further dressing is used The cavity is allowed to drain and is daily irrigated with a solution of chlorinated soda After all discharge has ceased the tube is discontinued

232. Suprapubic and Perineal Prostatectomy.

G G SMITH (*New England Journ Med*, July 17th, 1930, p 114) compares the results following suprapubic and perineal prostatectomy with special reference to the rate of mortality, the length of stay in hospital, and the functional results, the comparisons were based upon 100 cases of each type of operation The ages of the patients and the modes of anaesthesia were essentially the same in each Five of the patients treated by the suprapubic operation died after cystotomy, of 16 patients on whom the one-stage procedure was performed three died, giving a mortality of 19 per cent, while of 79 patients who had the two-stage operation nine died, a mortality of 10 per cent The total mortality in the suprapubic cases was 17 per cent, and in the perineal cases 3 per cent A slight modification of Hugo Young's perineal prostatectomy was employed, and the importance is emphasized of securing adequate bladder drainage by catheter until the tissues have become free of oedema and have had time to granulate, periurethral abscess occurred only once in the series The stay in hospital for the suprapubic cases averaged forty one and a half days after the one-stage operation, and fifty two days after the two stage operation, while for the perineal cases the average stay was thirty nine days. Comparing the functional results, the suprapubic cases showed a slight advantage, the perineal cases often being much slower as regards the regaining of complete control of urination, but the difference was not sufficient to outweigh the considerably lessened mortality shown by the perineal cases The author concludes that the perineal operation is less disagreeable for the patient, has a much lower mortality, and requires a shorter stay in hospital than the suprapubic operation, a shorter time is needed for its performance, bringing it well within the scope of spinal anaesthesia

233 Syndactylism.

J S DAVIS and W J GERMAN (*Arch of Surg*, July, 1930, p 32) divide syndactylism into two types congenital syndactylism, which is an inherited developmental defect with complete or partial webbing of the fingers or toes, and the acquired type, which may follow severe burns or an injury in which the destruction of the tissues of the fingers or toes results in the fusion of granulating surfaces The fusion varies in degree from a slight lengthening of the normal web between the toes or fingers to the complete fusion of the digits, in extreme cases the nails and phalangeal bones may be joined The terminal phalangeal bones are those most commonly fused In the acquired type of syndactylism the web is usually composed of dense scar tissue with contracture or distortion of the digits Many methods of operative treatment are described, and no single procedure has been developed to relieve all types and degrees of syndactylism In cases where there is complete fusion of fingers of unequal length separation should be secured as early as possible when inequality of growth becomes apparent. The fingers are separated in the midline, and the raw surfaces are covered with a whole thickness skin graft

A wide commissure between the fingers should not be made until the child is 6 or 7 years old, and the operation for the complete relief from syndactylism should not be undertaken until this age The formation of a satisfactory commissure, which to allow for subsequent shrinkage should be rather deeper and wider than that between normal fingers, is the aim of all operative procedure This is best accomplished by the use of flaps or whole thickness grafts sutured over the raw surfaces left after separation of the digits tension in any form being avoided Operative treatment for acquired syndactylism is limited, since the tissues dealt with are entirely scar or scar infiltrated and the blood supply is often insufficient to nourish the grafts, much improvement may, however, result in the worst cases if the scar is dissected out and covered with a pedunculated flap An operation for webbed toes is seldom necessary unless the fusion causes inequality of growth, in this case the procedure should be the same as that employed in the hand—namely, the separation of the fused phalanges

234 Multiple Primary Malignant Tumours.

D M ANGEVINE (*Canadian Med Assoc Journ*, July, 1930, p 38) briefly reviews the literature on the subject of multiple primary malignant tumours, and describes a case in which three such tumours were found in the ano-rectal region. A woman, aged 64, had suffered for two years before admission to hospital from general malaise, loss of weight, and anorexia *The melaena, constipation, and tenesmus persisted* Extreme pain developed in the lower part of the back and in both lower axillae, the lower part of the abdomen became more prominent, and large palpable masses were noted in both groins Surgical intervention was deemed inadvisable, and the patient died five days after her admission to hospital, and about two years after the onset of the illness, from terminal broncho-pneumonia and hypostatic congestion of the lungs At the post mortem examination several metastases and an almost generalized glandular enlargement were revealed Just within the anal canal, and filling most of the rectum, *three tumours were found Two of these were adenocarcinoma*, and the third a squamous-cell carcinoma. It is believed that the latter arose from the perianal mucous glands which are present in the human being and are analogous to the scent and sex glands of lower animals Angevine thinks that this is the first case recorded in which three primary malignant tumours are so closely related anatomically, and points out that all the metastases developed from the squamous cell carcinoma, none originating from the adenocarcinoma, which is unusual, moreover, the presence of a malignant tumour of the perianal mucous glands is an exceptional occurrence

235 Peritonitis due to Ascaris Infestation

W KLEBER (*Zentralbl f Chir*, July 26th 1930, p 1850) states that ascaris larvae after ingestion may reach the lungs through the intestinal vessels and liver, by way of the lymphatics and thoracic duct, or by perforating the intestine and reaching the peritoneum, subsequently travelling through the liver or the diaphragm Opinions differ as to which is the actual route normally traversed *There are usually no symptoms* during this stage of development A case is described in which sudden abdominal pain lasted for a few days, this was followed by vague pains in the lower abdomen for five months, after which the abdominal pain again became acute A diagnosis of appendicitis was made, but at an operation a number of calcified nodules were found in the peritoneum with an abscess in the pelvis On pathological examination of the material removed large numbers of ascaris larvae, surrounded by partially calcified granulation tissue and eosinophil cells, were found The patient made a good recovery The author remarks that since the presence of the free larvae in the peritoneal cavity gives rise to such pronounced symptoms and marked inflammatory reaction, this is evidently not the route normally taken in the migration of the larvae from the intestine to the lung

236. Spontaneous Urethrorrhagia in Stricture.

P GOROWITZ (*Urol and Cut Rev*, July, 1930 p 449), who records three illustrative cases in men aged from 37 to 49, states that comparatively little attention has been paid to spontaneous haemorrhage in urethral stricture, which was first described by Thompson Three explanations have been given for the urethrorrhagia The first is that the cause is a psychological trauma, rupture of the vessels occurring in erection The second is that the haemorrhage does not originate in the urethra but in the bladder, the condition being one of haemorrhagic cystitis or of congestion or infection The third explanation is that morbid changes within the urethra are the cause of the haemorrhage. On urethroscopic examination of the stricture Gorowitz has often found changes in front of the stricture in the form of swelling of the mucous membrane and granulations which bleed at the slightest touch Treatment consists in the removal of the stricture by gradual dilatation Operation is indicated only in cases of impermeable stricture

237 Malignant Pustule of the Penis.

A BATTISTA (*Urol and Cut Rev*, August, 1930 p 543), who states that he has found only one previous example of this condition on record, describes the case of a man aged 22, a skinner by occupation, who infected his penis by scratching. Within twenty four hours the organ became oedematous and the patient developed high fever and stupor A diagnosis of malignant pustule was made. Treatment consisted in the intravenous injection of 30 c cm of anti anthrax serum, subsequently, the injections was given subcutaneously On the thirteenth day local treatment was started with packs soaked in an autogenous vaccine, which were applied twice daily Complete recovery ensued

Therapeutics.

238 Medicinal Treatment of Hypertension

M H FINEBERG (*Journ Amer Med Assoc* June 7th, 1930, p 1822), who commends potassium thiocyanate for its sedative and hypotensive effect on many neurotic patients, relieving vertigo and other subjective symptoms, states that J B Nichols found that sodium thiocyanate in doses up to 15 grains daily reduced hypertension, but had no definite sedative effect Another author reported a series of 35 cases treated with potassium thiocyanate in daily doses of 4½ grains for one week, reduced to 3 grains during the second, and 1½ grains during the third week, there were only three failures The same dosage was used in another series of 59 cases of essential hypertension and 42 per cent of the patients showed a reduction in systolic pressure of 30 mm. or more Other authors have reported successes following the daily administration of 5 to 15 grains of sodium thiocyanate or of drachm doses of an 8 per cent. solution of the potassium salt three times daily In two cases, however, lassitude followed the administration of 1½ grains of the potassium salt, and in two other cases there were anginal symptoms, apparently due to a rapid fall of the blood pressure. Exfoliative dermatitis occurred in two instances after daily doses of 4½ to 30 grains Fineberg calls attention to certain factors which should be remembered in estimating the value of this treatment Spontaneous variation may occur in the blood pressure, and the suggestibility of the patient may be an important consideration Prolonged treatment is necessary to arrive at a definite conclusion, and a marked permanent reduction is necessary as a criterion of success As the result of an investigation with control cases he found that 22 out of 58 patients (37 per cent) treated with sodium bromide and phenobarbital for three months showed a sustained fall of 30 mm. or more in the blood pressure, while many patients whose blood pressure was unchanged experienced subjective improvement Potassium thiocyanate in doses of 4½ grains daily was ineffectual, but 57 per cent of refractory patients showed a fall of 30 mm or more after daily doses of 15 grains The subjective improvement was greater in patients under sedative treatment, but there was more reduction in the blood pressure when potassium thiocyanate was administered.

239 Bacteriophage Therapy Applied to Dysentery

J LONDON (*Indian Med. Gaz., July*, 1930 p 370) describes an outbreak of dysentery among the coolies on an Assam tea estate, 141 cases occurring Water and flies were eliminated as infecting agents, and the cause of the outbreak was ascribed to personal and indirect contact. The cases, both clinically and microscopically, presented all the features of bacillary dysentery, and it was therefore decided to treat all the patients with bacteriophage only, following the instructions for its use which are issued by the Pasteur Institute at Shillong In ordinary cases two doses were given each day well diluted on an empty stomach, the maximum number administered daily in any case was four None were given intramuscularly or intravenously The results in general were very satisfactory The blood usually disappeared from the stools in three to four days and the patient became less depressed and listless this early loss of toxicity was one of the most marked features. Of these cases, 103 who received no treatment but the bacteriophage were discharged cured and are reported to be now at work. The remainder did no respond so well mucus and diarrhoea with traces of blood persisted these were treated by emetine and salines, and in some cases intravenous organic arsenic was given and lavage was employed, of these 12 died the remainder recovered and are now in good health Thus, 129 out of 141 cases, or 91.3 per cent, were cured, and a notable feature is the

absence of recurrences to date A tabular summary supplied indicates that the results of bacteriophage therapy compare very favourably with those given by emetine and salines London adds that the pain and depression caused by emetine injections is a point greatly in favour of bacteriophage treatment.

240 **Calcium Therapy in Eclampsia**

HAVING noted in some cases of eclampsia that this state is accompanied by a hyperguanidinaemia, LAFFONT, MALMEJAC, and SIRJEAN (*Bull Soc d'Obstet et de Gynécol de Paris*, June, 1930, p 432) concluded that an antidote to guanidine might be efficacious in eclamptic conditions, according to Watanabe calcium salts appear to be indicated The present authors found that the coincident amounts of the blood calcium and guanidine vary in inverse proportion—that is, that hyperguanidinaemia is associated with hypocalcaemia Two cases of eclampsia are recorded in which injections of a calcium salt produced most satisfactory results In the first, 4 c.cm of somnifen were given intravenously, and 7 grams of calcium gluconate intravenously, intramuscularly, and subcutaneously Complete cure resulted in less than twenty four hours The second patient was given 15 grams of the lime salt and, since guanidine metabolism is most probably governed by the parathyroid glands, parathyroid extract was also injected In addition, this patient received ultra violet irradiation In this case complete cure was established in seventy two hours The authors remark that the eclamptic syndrome appears to yield to calcium medication, and that ultra violet rays are a valuable adjunct in the treatment

241 **Treatment of Juvenile Rheumatism**

N G HILL (*Brit Journ Child Dis*, April–June, 1930, p 81) records his observations in a paper based on the study of over 500 children treated at Queen Mary's Hospital, Carshalton, where rest under good hygienic conditions with a very gradual return to the normal activities of life is the basis of the treatment As a rule each child is nursed in bed for at least three months, after about five or six months in hospital a number of selected cases are transferred to a seaside convalescent home, where they are kept under general medical supervision They are then discharged at the end of about six months but most of the patients are kept under observation by being periodically examined by school medical officers or in general hospitals Although no specific treatment has been found, there are indications that calcium therapy in the form of calcium lactate or the subcutaneous injection of certain colloidal and other special preparations of calcium may be of value

Dermatology.

242. **Familial Xanthoma**

G HUFSCHMITT and V NESSMAN (*Ann de Derm et de Syph*, May, 1930, p 462) give a full description of generalized xanthoma occurring in four members of one family, a fifth child being free from the disease The ages of the patients ranged from 15 to 26, one, who would now have been 24, died suddenly in 1928 No hepatic or gouty histories were found in their antecedents, the mother, however, had some fine, yellow granulations of cholesterin under the mucosa of the lips and anterior face of the cheeks The children were normal and vigorous at birth, the xanthoma appeared between the ages of 3 and 5, first on the palms of the hands, it later became generalized About the age of 10 each child suffered from an attack of febrile articular rheumatism with painful swelling of the joints, these attacks have recurred ever since The question is raised whether this was a pure articular or a gouty rheumatism, owing to the fever, the authors incline to the former hypothesis An aortitis, present in all the cases, may have been due to the rheumatism or to a faulty blood cholesterin Other cardiac conditions, present in all the patients, were a systolic souffle at the base, which was propagated along the sternum into the carotids, hypertrophy of the heart, but not of the aorta, a small pulse, and hypotension Pallor, vertigo, and malaise were also common to all The clinical symptoms, which reached their maximum development in the eldest, are described as illustrative of all the cases A curious and unusual retrogression of the xanthomatous manifestations from the eldest to the youngest patient was noted, the tumours were decreasingly numerous and less fully developed The growths were present on the articular summits of the fingers, metacarpals, and elbows, and to a lesser degree on the knees and feet, at first sight they resembled the nodosities of chronic gout Their size varied from that of a pin's head to that of a small orange The overlying skin was normal, but of a rosy or cyanotic tint Violet coloured areas, which formed the base of these growths, were also found on the arms, thighs, and knees With the exception of xanthelasma of the lower eyelid and a small nodule on the lobule of the ear, the head, trunk, and abdomen were normal These growths were found to consist largely of cholesterin Various hypotheses have been advanced as to the pathogenesis, hypocholesterinaemia is always present, and the possible relation of the blood sugar and cholesterin is discussed Treatment is largely empirical Some growths may be excised, but operative measures are limited by the extent of the process Physical agents, such as x rays and carbonic snow, are useless, but solvent and oxidizing drugs (pyridine, manganese, and iron) which will convert the cholesterin into more soluble forms may be tried, as also may those that promote bile (and, therefore, also cholesterin) secretion, such as sodium oleate or sulphate. The question of diet has also to be considered

243 **Subcutaneous Cysticercous Infestation**

C K HU, O K KHAW, and C. N FRAZIER (*Arch Derm and Syph*, May, 1930, p 777) report six cases of cysticercosis of the tissues occurring in man, five affecting the subcutaneous and muscular tissues and one the cerebral cortex The patients were Chinese residing in North China, the cases being collected over a period of ten years and representing an incidence of 1 in 25,000 patients Two cases presented the unusual feature of serving as both definitive and intermediate hosts, the tapeworm being present in the intestines and the cysticercus in the somatic tissues In a series of 143 cases of intestinal taeniasis of 49 differentiated cases, 44 (90 per cent.) were due to *Taenia saginata* and the remaining five to *Taenia solium*, two of which also harboured *Cysticercus cellulosae* When the lesions are subcutaneous diagnosis is easy, if the possibility of the condition is borne in mind, since the cysts are multiple, freely movable, of elastic hardness, not tender, and averaging about 1 cm in diameter Diagnostically, they may be confused with sebaceous cysts and fibromas, but the former are usually attached to the overlying skin, and are not freely movable, the latter are not so sharply circumscribed, nor so likely to be multiple and uniformly small In two of the cases sensitization tests with fresh fluid from a cyst were negative The eating of poorly cooked pork must be avoided in countries where infection of animals with cysticercus is prevalent, patients with cysticerci in their tissues should be examined and treated for intestinal taeniasis, as a preventive measure, and also as a protection against the occurrence of fresh lesions

244. **Scleroderma**

P A O'LEARY and R NOMLAND (*Amer. Journ Med Sci*, July, 1930, p 95) record a series of forty eight cases of generalized scleroderma, and fifty five cases of the circumscribed condition, or morphoea In more than half of the generalized cases arthritis preceded or occurred simultaneously with the development of the scleroderma, and in 33 per cent the onset was preceded by varying degrees of vasomotor disease in the extremities The etiological factors were found to be generalized infectious diseases such as influenza, dysfunction of the endocrine glands and particularly the thyroid, and arsenism Although the dermal changes in the two diseases are similar, there is no parallelism between them as regards onset, course, clinical appearance, and prognosis, both diseases are occasionally present in the same patient The authors believe that generalized scleroderma is the cutaneous manifestation of a systemic disease in which vascular changes play a leading part When the onset of the scleroderma seems to be definitely related to an acute systemic infection some symptomatic relief follows medical and surgical treatment, the generalized form is disabling and usually fatal, in contrast with the benign characteristics of localized scleroderma

Obstetrics and Gynaecology.

245 **Full-time Extrauterine Pregnancy**

L D WILCOX (*Canadian Med Assoc Journ*, July, 1930, p 60) records an interesting case of ectopic gestation which proceeded to full term with the birth of a normal child At the date of reporting, five months after delivery, both mother and child were living and well The patient was a well developed woman, aged 29, and there was no previous history of venereal or puerperal infection The menstrual periods occurred every twenty eight days, they were somewhat prolonged, but otherwise regular She had three healthy children, the youngest of whom was 5 years old, there had been no miscarriages On her admission to hospital the patient complained of intense pain in the left lumbar region and the corresponding half of the abdomen, there was marked

restlessness The breasts were flabby, and no secretion was obtained with massage The abdomen was found to contain a large ovoid tumour, the greater part of which was to the left of the middle line, the upper part extending two hand breadths above the umbilicus there was very marked tenderness over this mass Foetal movements were observed frequently, but no uterine contractions were noted The diagnosis of pregnancy was confirmed radiologically The patient was prepared for operation with several intravenous injections of 10 per cent glucose in saline solution Under ether anaesthesia a high rectus incision was made with the object of avoiding any placental attachments A sac presented, with the transverse colon forming its upper boundary this was perforated and the child was delivered The cord was tied and cut close to the placenta which was densely adherent to the omentum, intestine and pelvic viscera and was left *in situ* The sac was closed with a continuous suture and the abdomen was closed without drainage The incision healed by first intention The patient gradually improved, and was able to go home within three weeks, her breasts never became engorged Wilcox draws attention to the favourable result of the operation which was planned to permit extraction of the foetus without disturbing the placenta thus obviating the inevitable shock and haemorrhage which would have followed in a patient who was critically ill.

238. Pyelitis in Pregnancy

H ROSSENBECK (*Z ärztlich f Gynäk*, May 3rd, 1930 p 1103) alludes to a series of 100 cases of pyelitis in pregnancy, in only two of which was artificial termination necessary He believes that conservative treatment by rest, medication, ureteral catherization, and lavage of the renal pelvis will nearly always bring about cure with continuance of gestation but if such measures are not adopted early enough there is considerable risk of spontaneous abortion. Early diagnosis of pyelitis gravidarum is greatly to be desired, and in right-sided cases (many of which are in error operated on for appendicitis) pyelography after intravenous injection greatly facilitates a correct decision The case is recorded of a primipara, aged 20, who in the seventh month had severe right sided pyelitis, the right ureteral ostium did not function, but pus issued after catheterization The general condition became worse, and after twenty four hours renewed attempts to catheterize the right ureter failed repeatedly, radiography showed a right angled ureteral kink. Signs of endocarditis having appeared, abortion was induced by vaginal hysterotomy and next day it was found possible to pass the catheter beyond the ureteral obstruction Recovery followed The production of the kink after the first catheterization is ascribed to the patient having removed the catheter which had been left in the ureter and to a descent (radiologically proved) of the foetus which presented by the breech the knee being in contact with the point of compression

247 Pathology and Treatment of Menorrhagia and Metrorrhagia.

J KREIS and MLLE J RIGAUT (*Gynécol et Obstét*, April, 1930, p 324) describe the connective tissue of the uterine mucosa in the normally menstruating uterus with special reference to the intercellular fibrous network which constantly present in the basal layer, is absent in the superficial layer until about the eighth day, after which the fibres increase in size and number in this layer until about the sixteenth day They also report in detail the findings in the connective tissue in the endometrium of 30 cases of menometrorrhagia in girls and adults in whom gross utero-ovarian changes were absent glandular hyperplasia was present in some but not all The observations were made in material obtained by curetting Necroses of connective tissue cells and fibres were found to be present in all these cases, scattered in foci throughout the mucosa, other areas showed varying phases of regeneration These endometrial connective tissue lesions, while responsible for the irregular haemorrhage, appear to the authors to be independent of an ovarian cause a morbid condition, primary or secondary, of the connective tissue manifests itself clinically by irregular haemorrhage in connexion with vascular alterations in the endometrium corresponding with the cyclic ovarian function It is suggested that in a large number of cases of functional excesses in menstruation the responsible etiological factor is hereditary syphilis this causes the connective tissue changes in the endometrium The evidence for this view is found in the observation that the patients although often Wassermann negative are of the asthenic type with varices, ptoses defective or atypical dentition defective capillary circulation acrocyanoses excessive haemorrhage at puberty and bad obstetrical histories Confirmatory evidence is derived from the clinical successes which follow antisyphilitic medication. The case is recorded of a girl who had polymenorrhoea at puberty, with a negative Wassermann reaction curettings at the ages of 16 and 20 showed glandular hyperplasia and a morbid condition of the endometrial stroma After antisyphilitic treatment the menstruation became normal, and a third curetting submitted to voluntarily a year later, showed a normal condition of the uterine mucosa

248. Cysts of the Corpus Luteum.

H MOLIN F CONDAMIN, and R JAMIN (*Lyon Méd*, May 11th, 1930 p 609) refer to the paper by W Shaw on pathological forms of the corpus luteum, which was contributed to the sixth British Congress of Obstetrics and Gynaecology (see *Journal*, May 21st, 1927, p 924), and report ten cases of cysts of this structure The authors point out that cyst formation or hypertrophy of the corpus luteum gives rise to clearly defined neuralgic syndromes which are curable by operation They recognize three varieties (1) the subacute form characterized by persistent and unilateral ovarian pain, in which operation is indicated after some months if the condition does not clear up, (2) an acute form associated with the menstrual disturbance simulating tubal pregnancy, and calling for surgical intervention, (3) a rather hypothetical acute but benignant form, in which a temporizing policy is indicated They discuss the rather obscure pathology of this condition and emphasize the importance of further investigation

249 Skin Lesions in Ulcus Vulvae Acutum.

F WALTER and I ROMAN (*Derm Woch*, May 24th, 1930, p 705), who record two illustrative cases, state that the acute ulcer of the vulva described by Lipschütz as due to *B crassus* is not only a local affection, but may also give rise to a general disease by dissemination of the organisms through the blood stream The present cases occurred in women aged 24 and 19 respectively, in whom acute vulvar ulcer was accompanied by a papulo-pustular eruption on the face, trunk, and limbs It is true that histological examination of a lesion did not show *B crassus*, and that cultures of the blood were also negative but the authors maintain that the organisms were rapidly killed by the defensive powers of the system, and that the skin changes were produced or kept up by the liberated toxins

250 Infarct of the Uterus

F LISI (*Arch Ital di Anat e Istol Patol*, March–April, 1930, p 250), who records an illustrative case, states that a true infarct of the uterus is very rare, only seven having been previously described by Herxheimer (1886) Popoff (1894), Chiari (1895) Geppert (1921), Brakemann (1925), Wermbter (1925), and Danisch (1926) respectively Lisi's patient was a cachectic woman, aged 70, admitted to hospital with pulmonary tuberculosis diffuse arterio-sclerosis, and pulmonary hypostasis The necropsy showed an ischaemic infarct of the posterior wall of the uterus due to autochthonous arterio-sclerotic thrombosis of the uterine arteries He excludes the possibility of the case being one of senile uterine apoplexy, and regards it as an example of acute passive congestion of the senile uterus occurring at the point of death

Pathology.

251 The Role of Cl. welchii in Pernicious Anaemia.

W L FORSYTH and Y B ABDOOSH (*Journ Lab and Clin Med*, May, 1930 p 730 have investigated the numbers of *Cl welchii* in the stools of healthy Egyptian prisoners A faecal suspension of definite opacity was prepared, and eight successive tenfold dilutions were made the original suspension was placed in tube No 1, the last dilution, 1 in 100 million in tube No 9 These tubes were used for plating the medium employed was glucose agar containing ferrous sulphate and sodium sulphite Anaerobes reduce the sulphite to sulphide producing black colonies Of these colonies over 90 per cent. were found to be formed by *Cl welchii* Davidson using this technique reported in 1928 that in healthy persons (Europeans) tube 3 represented the upper limit from which *Cl welchii* could be isolated on the other hand in patients with pernicious anaemia (which is very uncommon in Egypt) this organism could generally be isolated from tube 9 The present authors examining the faeces of over 100 Egyptians, have found that 21 per cent. of them showed the organism in high dilutions—that is in tubes 5 to 9 According to Davidson's standards they fell into the pathological zone. These prisoners were fed on a homogeneous largely vegetable diet and are stated to have had no previous bowel complaint. The authors conclude that the stools of healthy Egyptians have an anaerobic flora differing quantitatively from that reported by Davidson for Europeans

252. Concentration of Vaccinia Virus by Centrifugalization.

F F TANG (*Journ Exper Med*, June, 1930, p 859) collected vaccinia virus from rabbits inoculated on the skin five days previously The material was ground up with glass powder, and a 5 per cent suspension was made in hormone broth This suspension was centrifuged for thirty minutes at about 2,000 revolutions a minute, and the supernatant fluid was filtered through a Berkefeld V candle under a negative pressure of 50 cm of mercury Titration of the filtrate by the intradermal inoculation of rabbits showed that it was active up to a dilution of 1 in 800 The filtrate was then centrifuged at about 4,000 revolutions for apparently two hours, and titrations were made of the surface fluid and of the deposit, the surface fluid produced a slight reaction undiluted, but was inactive in a dilution of 1 in 10, while the deposit produced a reaction in a dilution of 1 in 1,200 Since it was possible that the virus was adsorbed on to inert particles in the broth, an attempt was made to remove these by fractional centrifugalization Fresh calf virus was ground up with pyrex glass powder and filtered The filtrate was centrifuged for one hour at 3,500 revolutions, then 5 c cm of the fluid from the surface was removed and centrifuged for four hours at the same speed The surface fluid and the deposit were collected separately, and the various layers were mixed to serve as a control All three samples were titrated on the same rabbit The control fluid was active up to a dilution of 1 in 500, the surface fluid was active at 1 in 10, while the deposit was active up to 1 in 1,500 From these experiments the author concludes that it is possible to concentrate vaccinia virus by centrifugalization, even in filtrates that have been subjected to preliminary centrifugalization to throw down inert particles present in the original filtrate This fact, together with the knowledge that the virus can be almost completely held back by Berkefeld N candles, indicates that the virus may be of considerable size

253 Colorimetric Determination of Sugar in Urine

J MĚLKA (*Bratislavské Lekarske Listy*, June, 1930, p 940) describes a method for estimating the amount of sugar in urine, it is based on the change of colour taking place at the reduction of picric into picramic acid To make the standard solution a test tube is filled with 8 c cm of distilled water, 1 c cm of a 1 per cent solution of picric acid, 1 c cm of a 10 per cent solution of sodium hydrate, and 0 5 c cm of a solution of glucose (1 1 grams of glucose in 100 c cm of distilled water) The mixture is then heated till the colour of the solution becomes permanent, it is then cooled, and after the addition of 4 c cm of a 5 per cent solution of gelatin the test tube is sealed To determine the amount of sugar in the urine a test tube similar to the first is filled with 12 c cm of distilled water, 1 c cm of a 1 per cent solution of picric acid, and 1 c cm of a 10 per cent solution of sodium hydrate The mixture is heated, and, after it has cooled, the diabetic urine, diluted with an equal quantity of distilled water, is added gradually by means of a micropipette in quantities of 0 05 c cm at a time, until the colour of the solution becomes similar to the one in the standard test tube, when the necessary calculation can easily be made This method is said to give fairly accurate results, and, being relatively simple, is recommended for use in general practice

254 Acute Food Poisoning caused by B coli

J D JANSEN and L E DEN DOOREN DE JONG (*Centralbl f Bakt*, June 26th, 1930, p 193) record an outbreak of food poisoning affecting several hundred persons who had attended a festive dinner in Rotterdam The symptoms of general malaise, severe vomiting, and offensive diarrhoea came on about one or two hours after the meal, pallor, cold sweats, a weak pulse, oppression in the stomach, and faintness were common, and some patients lost consciousness completely After thorough evacuation most of the patients recovered in about twelve hours, and were able to resume their work The authors obtained at once samples of all the articles of food consumed, and commenced their examination of these articles within a few hours of the meal Chief suspicion fell on a potato puree, which was swarming with bacteria This puree, after preparation, had been left for eight hours on the rack above the oven, and contained at the time of examination about 200 million organisms per gram, of which about 50 millions were *B coli* Examination of several strains of this bacillus recovered from different articles of food showed that they all had the same fermentation reactions, they fermented glucose, lactose, sucrose, salicin, and dulcite, gave a positive indol reaction, reduced nitrates, were positive to methyl red, Voges Proskauer negative, and failed to grow in citrate The authors identify doubtfully this organism as *B coli communior* Bread soaked in a broth culture of this organism, and left at room temperature for two days, produced diarrhoea and sometimes death when given as food to mice, similar results were obtained with strains from entirely different sources Since no salmonella organisms were recovered, and since chemical examination for heavy metals and alkaloids proved negative, the authors conclude that the outbreak was due to infection of the potato puree with *B coli*, the prolonged incubation of this material enabled the organisms to multiply to a prodigious extent, and to produce certain products which were responsible for the poisoning

255 Gastric Secretion in Cancer of the Stomach

W S POLLARD and A L BLOOMFIELD (*Bull Johns Hopkins Hosp*, May, 1930, p 307) have studied 19 cases of gastric cancer If pyloric obstruction was present the stomach was washed out for several days before the tests were made, in no case was food taken during the preceding eighteen hours A small tube was then passed into the stomach, and the total secretion was aspirated continuously and collected over successive ten minute periods After two or more fasting periods histamine (0 1 mg for each 10 kilo of body weight) was given subcutaneously, and the secretion was collected over three to six further ten minute periods No test meal was introduced into the stomach The material collected consisted of a more or less mucoid grey or brown fluid, which sometimes contained blood, its chief characteristic was its small volume, never over 10 c cm After histamine stimulation there was on uniform rise, true gastric secretion being almost entirely in abeyance, the material obtained was mainly mucus Most of the patients had anacidity of the gastric juice, in only three did the values approximate the normal, and values above the normal average were not met with. Whenever acid was present in appreciable quantity pepsin was also obtained in amounts varying up to the normal limits When considering gastritis associated with growth, the authors suppose that such gastritis may be the direct cause of the defective secretion, they do not accept the common assumption that the growth produces the gastritis, but rather that gastritis precedes the growth Cancer appears to arise almost always on the basis of an already existing lesion which is usually a chronic gastritis, and less frequently a peptic ulcer

256. The Serological Diagnosis of Undulant Fever

H MEISEL (*C R Soc de Biologie*, June 6th, 1930, p 534) in Poland has examined the serum from 687 patients for agglutinins to *Br abortus*, the serums were sent to the laboratory for a Widal or a Weil Felix test The serums from two patients, each of whom was suffering clinically from undulant fever, agglutinated Bang's bacillus to a titre of 1 in 800 or 1 in 1000 Neither of these serums had any agglutinating action on the typhoid or paratyphoid A and B bacilli, or on *B proteus* X 19 On the other hand, among 167 serums agglutinating one or other members of the enteric group, there were five which at the same time agglutinated *Br abortus* to a titre of 1 in 50 or 1 in 100, and among 186 serums agglutinating *Proteus* X 19 there were 11 which agglutinated *Br abortus* to a titre of 1 in 50, 1 in 100, or 1 in 300 According to Kristensen a titre of 1 in 100 to Bang's bacillus is diagnostic of infection with this organism, but the author maintains that this criterion is liable to lead to errors of diagnosis To ascertain whether the positive results with Bang's bacillus obtained with the serums of certain enteric and typhus patients were due to coagglutination the author tested serums, prepared by inoculating animals with typhoid or paratyphoid bacilli or with *Proteus* X 19, against *Br abortus*, no agglutination occurred He therefore concludes that these results are not explicable on the basis of coagglutination, but indicate rather that the patients have at some previous time suffered from undulant fever.

257 Bacteriology of the Blood in Chronic Infectious Arthritis

H M MARGOLIS and ANNA H E DORSEY (*Journ Infect. Dis*, June, 1930, p 442) have performed blood cultures on 89 patients suffering from chronic infectious arthritis The technique employed varied throughout the investigation In some instances whole blood was used, in others blood clot or the sediment of centrifuged citrated blood, the media being beef infusion, dextrose, or placenta broth From nine patients non haemolytic streptococci—either a haemolytic or indifferent—were isolated These results are very much lower than those obtained by Cecil, Nicholls, and Stainsby, who recorded streptococci in 61 5 per cent of their cases studied, the reason for this discrepancy is not clear The authors conclude that the occurrence of streptococci in the blood as well as in the joints of patients with arthritis is indicative of their etiological significance in this disease.

An Income of £500 a year—

AND A CASH PAYMENT WHEN YOU RETIRE

THAT is what a man aged 30 next birthday may secure by taking out an Endowment Assurance Guaranteed Bonus Policy with the Prudential

The Annual Premium would be £88 10s 10d., but allowing for Income Tax Rebate at 2s in the £1, and assuming that the rate and conditions of rebate remain unchanged, the

Yearly Outlay would be £79 : 13 : 9

and in the event of death before 65, £2,500 plus guaranteed Bonus Additions of £75 a year (almost as much as the yearly outlay) would be available for his dependants

If you would like a guaranteed income of £500 a year at age 65 or earlier fill in and forward this coupon or write mentioning this Journal

To
THE PRUDENTIAL ASSURANCE CO LTD.,
HOLBORN BARS E.C.1

Please send me particulars of an Endowment Assurance Policy with Guaranteed £3 . Bonus which will enable me to secure an assured income of £ - --- at age ---

FOR DEAFNESS

Doctors prefer "ARDENTE" because—

'ARDENTE" STETHOSCOPE

Mr I H Dent makes a Stethoscope specially for members of the medical profession suffering from deafness Many are in use and excellent results are reported on the latest as evidenced by the interest shown at the last B M A Meeting

1 It is individually fitted to suit the case for young middle aged, or old
2 It is simple and true to tone and leaves the hands free
3 It removes strain, thus relieving head noises giving inconspicuous hearing
4 It conveys sounds from varying ranges and angles.
5 It is entirely different unequalled, and carries a guarantee and service system
6. It is suitable for "hard of hearing" or acutely deaf through various causes.
7 It is helpful for conversation, music talkies wireless, home, office, public work, and sports

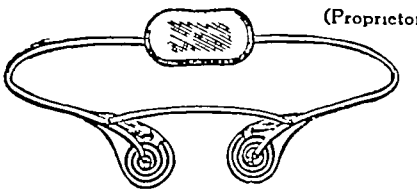
"The Rose Corset-Belt"

for Accurate Abdominal Support and Comfort

EXTRACT FROM THE "BRITISH MEDICAL JOURNAL," DEC 10th, 1927—



"Visceroptosis is the cause of so much discomfort and ill-health and an ill-fitting or wrongly applied belt or corset may aggravate rather than diminish the subjective effects of this condition MADAME ROSE has for many years devoted special attention to this problem, and we have good reason to believe that she has given help and comfort to a considerable number of sufferers We have received assurances from medical men who have sent patients to her, that she gives personal attention to each patient that she takes great care in adapting and adjusting the support to the particular needs of the case'

Printed and published by the British Medical Association at their Office, Tavistock Square, in the Parish of St Pancras in the County of London

Who is your Patient?

A MAN or woman? Adult or child? A very necessary question when you prescribe a remedy for constipation—unless it is Agarol Brand Compound the original mineral oil and agar-agar emulsion with phenolphthalein. Then you need to give thought only to the dose And that is simple Begin with a tablespoonful for adults and a teaspoonful for children, at bedtime. Reduce the dose as improvement takes place.

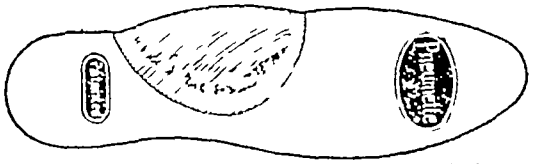
No excess of mineral oil to make adjustments of the dose necessary An emulsion as fine as it can be made, that mixes thoroughly with the intestinal contents, carries unabsorbable moisture to them and makes evacuation easy and painless

Besides, it *gently stimulates* peristalsis, and thereby makes the result certain and the re-education of the bowel function possible.

One tablespoonful at bedtime —is the adult dose

Final decision on the true worth of Agarol Brand Compound rests with the physician We will gladly send a liberal quantity with literature, for trial.

AGAROL BRAND COMPOUND *for Constipation*



FRANCIS NEWBERY & SONS, LTD, 31-33, Banner Street, London, E.C 1

Syrup Cocillana Comp.

PARKE, DAVIS & CO

THIS thoroughly efficient soothing and expectorant combination is particularly adapted for the treatment of acute bronchitis, also of chronic bronchitis when secretion is scanty and cough excessive In the inter-paroxysmal stages of asthma, its administration is useful to allay dyspnœa. It does not arrest the secretions or cause constipation. It is most agreeable in flavour and attractive in appearance.

Each fluid drachm contains —

Tincture of Cocillana	5 mins	Fluid Ext. of Squill	1/4 min.
Tincture of Euphorbia Pilulifera	15 mins	Fluid Ext. of Senega	1/4 min.
Syrup of Wild Lettuce	15 mins	Tartarated Antimony	1/184 gr.
Cascarin (P D & Co)	1 gr.	Menthol	1/100 gr.

Ethylmorphine Hydrochloride 1/32 gr.

Syrup Cocillana Compound (P D & Co) is supplied in bottles of 4 8 16 and 80 fl ounces.

Front View
Salt's
Patent Gastroptosis Belt

Salt's
Patent Kidney Belt

JUST as medical opinion rightly deprecates the taking of a patent medicine as a cure-all for all and sundry disorders, so the same considered opinion is daily growing that successful post-operative treatment is best insured by individually-made appliances to the Medical Man's own diagnosis

It is a policy that the House of Salt has consistently recommended and practised for 137 years

To-day—more than ever—in view of speciously advertised and so-called universal appliances—Salt policy of making each appliance to special individual measurement is the best method of providing for the patient's comfort and relief of the diagnosed disability

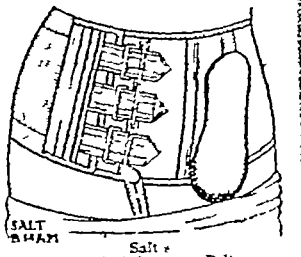
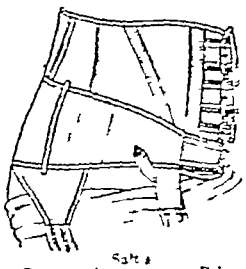
SALT



SPECIALISATION IN SERVICE

SUCH specialisation in manufacture might seem of itself a sufficiently meritorious point yet the thoroughness of Saltair Surgical Service is evidenced in other details



¶ Although each Salt appliance is specially made for the individual case, yet we take all responsibility regarding fit and suitability under the terms of our comprehensive guarantee

¶ We do not approach the public direct. All our advertising is directed to the Medical Profession only

¶ Visits are made periodically by qualified male and female fitters to many provincial centres on special dates where practitioners may send their patients for the fitting of special appliances.

Local Anæsthesia in Surgical Practice

CHRONIC ABSCESS OF RIGHT TIBIA

Typical Case

Mrs H S D, aged 29 years

Diagnosis Chronic osteomyelitis (bone abscess) of the right tibia

Operation Channelling excision of necrotic tissue and introduction of Beck skin flaps

Anaesthesia Circumferential infiltration block 90 c c of 1 per cent Novocain-Adrenaline solution

Technique of Anaesthesia 90 c c of Novocain-Adrenaline solution was introduced circumferentially—the needle passing laterally and posteriorly to the tibia just below the knee-joint A small discharging sinus was excised, the periosteum elevated and a channel cut by means of the mallet and gouges removing approximately one-third of the circumference of the tibia A number of chisel points were broken because of the eburnation of the bone The endosteum was found to be sensitive but thorough curettage was made Pedicle flaps were turned in on each side and good results followed —EXTRACT from PRACTICAL LOCAL ANAESTHESIA (Farr)

(Full technique of this and one hundred other operations under Local Anaesthesia will be found in the above work published by Henry Kimpton 263, High Holborn London W C 1)

THE SAFEST LOCAL ANAESTHETIC

Ample supplies of Novocain are available for the use of Surgeons at all the chief Hospitals Specify "Novocain" for your next operation

Does not contain Cocaine, and does not come under the Dangerous Drugs Act.

Mellin's Food
A MILK MODIFIER

"MODIFIED MILK IN INFANT FEEDING"

The above-named booklet of 64 pages will be gladly sent to members of the Medical Profession

MELLIN'S FOOD is specially prepared for modifying and adjusting cow's milk to meet the nutritive needs of infants deprived of human milk

No matter whether certified, pasteurised, dried, or condensed milk is employed, its digestibility and its value as nourishment for the baby is enhanced by the addition of Mellin's Food In other words, milk in any form is better borne, more completely utilised, and its nutritive constituents more appropriately balanced if properly modified with Mellin's Food

There is no milk modifier exactly like Mellin's Food, and its continued recommendation by a large number of members of the Medical Profession is ample evidence of its outstanding advantages

Further particulars and samples will be supplied on request

MELLIN'S FOOD LTD, LONDON, S.E.15

SELECTIVE GERMICIDAL POWER
STREPTOCOCCUS HAEMOLYTICUS

IT is not generally recognized that antiseptics exhibit wide variations in their power of killing *different* bacteria Phenol, the first antiseptic ever used, affords an example of this It differentiates so markedly between the typhoid-coli group and the Gram-positive cocci, that, if added in the proportion of 1 in 200 to a medium inoculated with a mixture of B coli and streptococci, the former are killed and the latter multiply

Monsol, which is derived from a by-product of the Mond power-gas process, differs radically from other coal-tar antiseptics in its selective action, which is the opposite of ordinary coal-tar preparations Its power of killing the STREPTOCOCCUS PYOGENES, and notably the strain HAEMOLYTICUS, is more than 10 times greater than that of pure phenol or of lysol

Monsol is non-irritant, and can be applied in effective dilution even to mucous membranes In view of these facts it is not surprising that Monsol has been found to have unprecedented qualities in the treatment of Streptococcal infections

Monsol can be applied to the treatment of septic conditions of the SKIN, the MOUTH and THROAT, and the MUCOSA, and is especially indicated in Obstetrics

A suggestion

We, the proprietors of Humanised Trufood, ask the medical profession to base their judgment of our product on its efficacy in *the most difficult cases of infant feeding* We make this suggestion because we know that many hundreds of your colleagues place *implicit faith* in Humanised Trufood as the result of their experience with it in the most serious cases of infant feeding

The truly phenomenal success of this product is due to the fact that it is practically a replica of breast milk, both in the *proportion* and *condition* of its constituents, and in its reaction in the child's system

Samples and literature promptly sent on request.

MEDULLA RUBRA

BONE-MARROW IN ANAEMIA FROM HAEMORRHAGE

W Borchardt (*Deut med Woch* March 28th, 1930 p 521) records the results of his experiments on young dogs in which anaemia had been artificially produced by the removal of about half their blood In the first series some of the animals were fed with rib marrow others with marrow from the long bones Control animals received a corresponding amount either of fat or of liver extract The basal diet in each case contained a sufficiency of iron (5 mg per cent) Only the animals receiving the red rib marrow showed a definite increase of weight and their haemoglobin formation was more rapid than that of the others. In the next series the experiment was repeated but the iron content of the diet was reduced to 1 4 mg per cent The result was similar but more striking the dogs receiving the rib marrow regaining their haemoglobin far more quickly than the others.

THIS extract from the "Epitome of Literature," published in the "BRITISH MEDICAL JOURNAL," dated May 3rd last, is important as representing, in 1930, a complete justification of the formula upon which

Roboleine

THE FOOD THAT BUILDS THE BODY

has been produced without variation during the past twenty five years

The success of ROBOLLINE is thus due to intelligent anticipation and to consistently maintaining the highest possible standard of manufacture

Medical Practitioners are asked to satisfy themselves of the merits of ROBOLLINE, for which purpose testing samples will be gladly sent upon request.

Bismuth in Syphilis

By common consent bismuth has taken a well-defined place in syphilo therapeutics, and the employment of preparations containing this metal (or one of its salts) has become a matter of routine in certain conditions

Syphilologists are not unanimous in their recommendation of any particular preparation but most of them appear to favour an aqueous fine suspension of a sparingly-soluble salt, such as the oxychloride

Bisoxyl is made to such a specification it is a suspension in water of bismuth oxychloride in an extremely fine state of sub-division Clinical evidence obtained over a considerable period demonstrates not only the therapeutic value of Bisoxyl, but also the fact that injections of it are practically painless

HOW GIBBS HELPS THE DOCTOR

Making a Nation Tooth-Conscious

Through Gibbs extensive advertising and their highly-organised educational work, the people of Great Britain are gradually being awakened to a realisation of the true value of their teeth

This is one of the most valuable phases of Gibbs co-operation with Doctor and Dentist On every hand the profession is bewailing the dreadful apathy of the public in dental matters. Gibbs endeavour to counteract this by vigorously setting out the tremendous advantages to be gained by developing and maintaining perfect teeth. Again and again the story is reiterated—health, beauty, success, happiness, depend upon perfect teeth

By reason of this intensive, continuous effort, an ever-increasing body of the public is accepting the ideal of perfect teeth as a reasonable possibility.

When the history of dentistry in this age comes to be written, it will be recorded that the House of Gibbs, a frankly commercial organisation, had not a little to do with whatever progress is made by bringing about the practical application of the Doctors' and Dentists' ideals to the mass mind so that they were definitely realised in the individual

GIBBS DENTURE TABLET

Gibbs new Denture Tablet is for cleaning Dental Plates, Bridgework (both gold and vulcanite) and artificial teeth It gives a high polish, removes stains, makes plate or teeth sterile and antiseptic without in any way injuring the softest gold or the finest vulcanite or platinum The formula has been submitted to and approved by important members of the Medical Profession

OVALTINE

IN GALACTOSIS

Diet in lactation is a matter of no less importance than diet during pregnancy

"Ovaltine" completely meets the requirements of the diet of the nursing mother by providing adequate and appropriate nourishment

It is easily digested, wholly nourishing, and does not convey any noxious or unpalatable substances to the breast milk For these reasons 'Ovaltine" will be found a most dependable prescription for establishing galactosis

"Ovaltine" is recommended to be given about the sixth month of gestation and should be continued throughout the nursing period A rich milk secretion is thus encouraged and the health of the patient safeguarded against overstrain

As an example of the nutritive power of "Ovaltine" it may be stated that one cupful yields more nourishment than 3 eggs or twelve cups of beef-tea

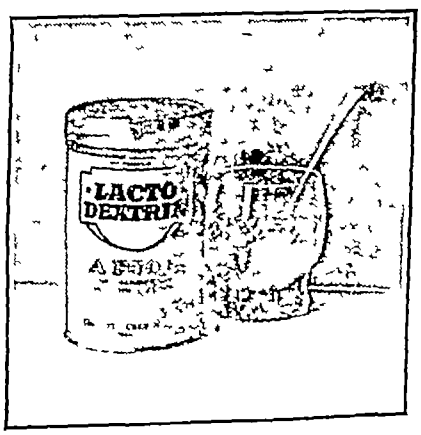
Supplied in 5 gm and 20 gm bottles in tablets (1 75 gr) and in enteric-coated tablets (½ gr)



Visit our Stand (No 148) London Medical Exhibition, Oct 20th—24th

A palatable combination of Lactose & Dextrin

for changing the intestinal flora

Lactose 73%, dextrin 25%—that is the proportion in which these carbohydrates are combined in this new food for changing the intestinal flora Both are more slowly absorbed than other carbohydrates, and both are able to reach the colon in sufficient quantity to cause a luxuriant growth of protective flora An acid reaction of the intestinal contents unfavourable to toxic organisms is thus produced —Lacto-Dextrin being highly efficient in promoting the growth and development of both B acidophilus and B bifidus in the colon In this pure carbohydrate food both lactose and dextrin are presented in a palatable and agreeable combination

PSYLLA

an accessory for use in conjunction with Lacto-Dextrin

Where bulk and lubrication of the intestinal tract is also required, the use of BATTLE CREEK Psylla (Plantago Psyllium) is invaluable as an accessory The small brown seed when in contact with water swells into a soft gelatinous mass and acts most effectively both as an emollient and intestinal evacuant

Samples and literature of both these intestinal products will be sent to members of the Medical Profession on request to Coates & Cooper 41 Gt Tower St, London E C 3, Sole Distributing Agents for the United Kingdom and Irish Free State

LACTO-DEXTRIN

Manufactured by the BATTLE CREEK FOOD CO, Mich, U S A

Invaluable as a Galactagogue

This nourishing and sustaining food drink is helpful to nursing or expectant mothers

NOT only hundreds, but literally thousands of cases are recorded in which this well-known preparation — Horlick's Malted Milk — has proved its efficiency as a body-building food

It is particularly valuable as an addition to the diet of the expectant and nursing mother For Horlick's is a perfectly balanced food containing fat, proteins and soluble carbohydrates combined together in correct nutritive ratio It is prepared from fresh, full-cream cows' milk, selected wheat and malted barley — and, during manufacture, is partially predigested to ensure easy assimilation

Horlick's is rich in valuable malt sugars, but contains neither cane sugar nor free starch It is therefore extremely easily digested, and highly productive of energy

These characteristics make it valuable as a galactagogue Its abundant nutriment supplements any deficiencies in the mother's regular diet, and promotes a regular and nourishing supply of milk, and its easy digestibility makes it acceptable when other forms of nourishment are unwelcome

Taken during pregnancy, it builds up the mother and helps to maintain her vitality A cupful taken regularly first thing in the morning frequently abolishes and almost invariably *alleviates the discomfort of morning sickness*

Horlick's is now obtainable in two forms — the original, natural-flavoured Malted Milk, and the new Chocolate Flavoured form — identical in its constituents with the original Horlick's, but flavoured with fine chocolate Horlick's is sold in sealed glass bottles, price 2/-, 3/6, 8/6, 15/- Also in tablet form

Further details may be obtained from Horlick's Malted Milk Co, Ltd., Slough, Bucks

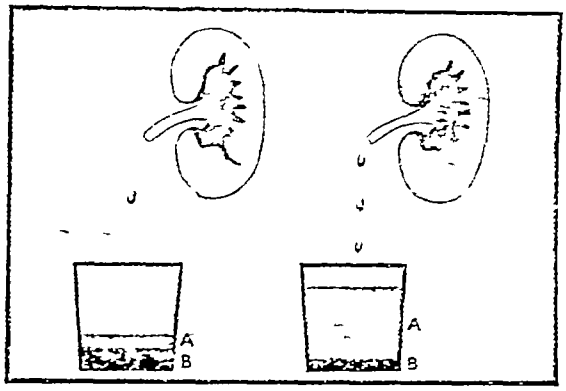
Prescribe this Coffee in Diuresis



H.A.G. COFFEE

GUARANTEED

97%

DECAFFEINIZED

WILL NOT AFFECT THE KIDNEY

The kidney on the right is influenced by caffein. It is compelled to work harder than normal and excretes a larger amount of Urine (A). Yet the quantity of ejected salts is equal, while the amount of compact substances (B) is diminished. (Courtesy of Dr K. B. Lehmann of the University of Wurzburg and Professors L. Tiffenau and H. Busquet, of the Academy of Science, Paris).

PHYSIOLOCICAL research has definitely determined that the caffein in coffee causes diuresis by stimulating the kidney parenchyma and increasing blood pressure

You know how hard it is to make your patients abstain from drinking coffee or tea—even when they know that it is bad for them

In such cases H.A.G. Coffee can be confidently recommended. Being 97% decaffeinized, H.A.G. Coffee does not contain enough of the drug to be harmful in even the most acute kidney conditions

A DELICIOUS BLEND

Harmless though it is H.A.G. Coffee is by no means a substitute. It is REAL coffee blended from the finest varieties. But all the original deliciousness is retained—because the caffein is extracted from the raw beans BEFORE ROASTING.

Thousands of physicians abroad have found H.A.G. Coffee a safe and effective prescription for every condition where caffein would be harmful. They have found also that their patients usually prefer H.A.G. Coffee to their customary coffee. Your patients will enjoy it too.

COMMON COLD

Every year we find at this season an increasing demand for prophylactic courses of our "Common Cold Vaccine" It is undoubtedly recognized that Vaccine Therapy gives good results in this connection, and it is known that the largest measure of success may be anticipated when the course is commenced two or three weeks before the season when the person is usually susceptible

EVANS' "Common Cold" VACCINE No. 3

Prophylactic

Micrococcus catarrhalis	200 mills.
Diplococcus pneumoniae	200 "
Streptococci	200 "
Bac Friedlander	100 "
Bac. Septus	100 "
Staphylococci (alb & aur)	200 "
Micrococcus tetragonus	100 "
Bacillus influenzae	100 "

1 200 Mills per c.c

Strongly recommended as a prophylactic and also in the treatment of inflammatory conditions of the upper air passages

Supplied in 1 c c Ampoules, Rubber Capped Bottles, and boxes of graduated doses

Brochure on "Vaccine Therapy" may be had on application

FOUR GREAT ARABIAN PIONEER RULERS—The Holy War by means of which the Arabians built up their vast empire once ended the dominions were sub-divided into Caliphates Then began a wonderful era of progress in the spread of civilisation The Caliph Hisham began the restoration of order in the interior and consolidated the empire During his reign the state archives were kept with a scrupulousness unknown elsewhere he maintained justice impartially and set an example of upright administration. The reign of the Caliph Al Mahdi, his successor was one of great prosperity He built new mosques and enlarged and beautified old ones made cities secure stimulated trade assisted the poor and encouraged the arts and sciences Al Mahdi indeed prepared the way for the brilliant reign of the most celebrated and splendid ruler of the Arabian empire *Harûn-al Raschid* whose coin (A.D 8o5) is here reproduced His court became the centre of light and learning to which flocked scholars and students from all parts He is said to have received an embassy from Charlemagne and to have sent one to China. He and his son Mamûn, were perhaps the two greatest of the Abbasid caliphs

THE CONSTIPATION SYNDROME

Whether the symptoms associated with constipation are partly toxaemic or entirely due to neuro-muscular disorder, there is no doubt about their reality or their gravely disturbing effect on bodily and mental efficiency

The influence of emotion, acting through the mediation of the sympathetic nervous system, on bodily processes—markedly on those concerned with alimentation and elimination—is reversible, the psychic consequences of discordant activity of the involuntary muscles being no less striking

Many vague discomforts and disturbances of health which are often brushed aside as neuroses, or as consequent on undefined focal infections, are, in fact, brought about by disharmonized or ineffective peristalsis

Thus, we suggest, is explained the undoubted benefit which patients suffering from such disturbances often derive from a morning glass of Eno's "Fruit Salt," taken regularly over a period of a few weeks In addition to—or by reason of—its purity and its complete freedom from such mineral salts as Epsom and Glauber, Eno is pleasant and refreshing to the palate, as well as effective in action It has the further merit of being non-habit-forming

"The Doctor's Emergency Reminder"

The Proprietors of ENO's "Fruit Salt" will deem it a privilege to send to any member of the Medical Profession a copy of the latest of their series of "Medical Reminders"—with or without a bottle of their preparation as desired "The Doctor's Emergency Reminder" summarises briefly a few points in connection with the treatment of poisoning and various other emergency cases It is bound in black morocco limp to conform to the style of the previous publications in this series

Observations
ON
THE CONTROL OF TRACHOMA *

BY
N BISHOP HARMAN, M.A., LL.D. F.R.C.S.,
SENIOR OPHTHALMIC SURGEON TO THE WEST LONDON HOSPITAL
OPHTHALMOLOGIST TO THE EDUCATION DEPARTMENT
OF THE LONDON COUNTY COUNCIL

TRACHOMA is practically extinct in England. It is still prevalent in some parts of the British Empire. It is rampant in some Eastern countries. Trachoma was at one time common in England. The conditions that have conduced to its virtual extinction are worth investigation. They may point the way to measures calculated to secure a similar result elsewhere.

The necessity for control of a disease depends upon the measure of the damage done by it. To obtain this measure there would be needed a census of the eye conditions of the population. This is manifestly impossible. But we can fairly compare figures drawn from the examination of sections of the population. These, although not national maps, may be fair average samples. Hospital figures cannot be considered such samples, for they are obtained from selected portions of the population. The most desirable figures are to be obtained from the schools, and from the examination of recruits for military service.

Van Millingen,[1] in 1895, collected figures for eighteen countries. Clemow,[2] in 1903, supplemented these figures. They showed the wide spread of the disease and the unequal incidence in the several countries. I have collected some later figures, and these show that whereas in some countries there is an effective control of trachoma, in others the problem is still of great magnitude. From these figures we may judge the vast amount of suffering and loss of economic efficiency caused by the disease in countries where it is rife.

Egypt still heads the list of afflicted countries. In the last report[3] of the Ministry of the Interior of Egypt there are some astounding figures of the prevalence of trachoma among school children. An ophthalmic survey was carried out among all the pupils of the primary schools in certain capital towns or the provinces in which there were ophthalmic hospitals. There were seventeen schools with 8,045 pupils, 91 per cent. of all pupils were found to be infected with the various stages of trachoma whilst 23 per cent. of the total were found attacked with the serious stages of trachoma. The figures are so amazing that one might ask whether the diagnosis of trachoma in so great a proportion of the children could be justified and whether perhaps some other follicular condition might not have accounted for many. But there are available the series of reports of this department when the work was under the direction of A. F. MacCallan which fully bear out the high incidence. Also, there is Lister's[4] record of the examination of the Egyptian members of the Labour Corps employed in France by the British authorities in the great war—"at a low estimate 45 per cent. were either suffering from or had had trachoma."

China runs Egypt close. Some 25 per cent. of the population appears to be affected. In the dramatic story of Professor Harvey Howard's captivity by Chinese brigands[5] there is this passage:

> Famines, floods and disease are rampant in China, but it is common knowledge that the most devastating of these three is disease. And of all the disease the one that is the cause of the most misery and economic distress is probably trachoma. It is found all over China, it affects nearly every home and all classes of society. From statistics I had gathered I had come to the conclusion that fully one hundred millions of Chinese people have trachoma, and that probably five million new cases, mostly children, develop each year. I had estimated that not less than one million Chinese are blind in both eyes, and that three or four millions more are blind in one eye; further that not far from twenty millions have had their vision so much impaired by inflammation and the formation of scar tissue due to trachoma that they are able to eke out only the barest kind of existence.'

The situation in India is better. Members of the Indian Medical Service have told me that although there is much trachoma it is less severe than in other Eastern countries and is less important as a cause of blindness. The reports of the Madras Government Ophthalmic Hospital for the six years from 1923 to 1928 show that of an average of 21,000 new patients each year about 4·5 per cent. were suffering from trachoma.

There are two recent reports for European countries in the papers of the League of Nations. In Italy, Lutraria[6] reports that trachoma is met with in almost all parts, but it is most common in the islands of Sardinia and Sicily. The army figures of 1913 show that of 502,221 conscripts 3,543, or 0·7 per cent., were rejected for chronic conjunctivitis believed to be trachoma. In some of the islands the proportion of rejections was four times as high.

In Holland, Josephus Jitta[7] reports that trachoma is found only in Amsterdam, mostly among the poorer Jews. A commission of inquiry sitting in 1914–17 reported the existence of 3,300 cases. Of 65,418 Christian children 2,396 or 0·6 per cent., and of 7,062 Jewish children 625 or 8·8 per cent., had trachoma. He is of opinion that trachoma is not endemic in the country, but that it was imported from Poland and Russia. He states that it is above all a family disease. Children are affected at an early age either by their parents or by older children.

In the British Isles Ireland shows most trachoma. Story[10] reported that there was a decrease towards the end of the century, but that in later years it has increased.

> Most of the credit for this increase is to be given to the American doctors who inspected all immigrants to the United States at the Irish ports and remorselessly refused embarkation to any with even doubtful signs of trachoma. Consequently large numbers of most undesirable aliens were left stranded in Ireland—whole families perhaps from far regions of Eastern Europe and trachoma accordingly became more prevalent in this country.

In England the figures collected in 1922 by the Committee on Blindness[11] were informative, but to my mind the best picture of present conditions is given by the figures of the London school children. London is a vast area; it includes every variety of social condition and a considerable alien community. For the children in the elementary schools there is a regular medical inspection and there can be no doubt that every case of trachoma is accounted for. The cases found in the years 1925 to 1929 numbered 26, 20, 15, 16, and 27, so that for five years on an average roll of 650,000 children there was an average of under 21 cases of trachoma a year, or 0·00032 per cent. When we recall the risks of importation of trachoma through the huge shipping area of the Thames I think you will agree that trachoma is practically extinct in London.

In the United States, according to Webster Fox,[1] there is little trachoma among whites except in some isolated parts of Kentucky, West Virginia, southern Illinois and Ohio. It is common among the Indians. In 1912 of 39,231 Indians examined in reservations 8,840, or 22·7 per cent. had trachoma. The percentage varied in different places from 68·8 to 0·2. In 1924 the Indians of three reservations were examined to the number of 18,830; trachoma was found in 3,986, or 21·2 per cent.

The foregoing figures are sufficient evidence that there is need for a better control in some countries than exists at the present time, and that no country can relax its vigilance.

Clinical Conditions

Trachoma means 'a roughness' and a roughness of that silkiest of tissues the conjunctiva. The name is a good one. In typical cases the roughness of the tarsal conjunctiva is uncanny. The term is an old one, and the disease is old. The disease was described with an accuracy that will be little bettered to-day in the works of Hippocrates and in the later authors of the Greek school, Aetius, Paulus Aegenetus, and Alexander Trallianus. There is one passage in Celsus which may be cited:

> Pejus etiamnum est (genus videlicet lippitudinis) ubi pituita pallida aut lurida est lacrimæ calidæ et multa profluit; caput

* Made in opening a discussion in the Section of Ophthalmology at the Annual Meeting of the British Medical Association, Winnipeg, 1930.

calet, a temporibus ad oculos dolor pervenit, nocturna vigilia urget: siquidem sub his oculus plerumque rumpitur, votumque est, ut tantum exulceretur Intus ruptum oculum febricula juvat si foras jam ruptus procedit, sine auxilio est Si de nigro aliquid albidum factum est, diu manet At si asperum, et crassum est, etiam post curationem vestigium aliquod relinquit (Lib VI, cap vi)

The characteristic signs of the disease in its early stages are the slight ptosis of the upper lid, and a variable degree of discharge from the conjunctiva The membrane shows a profuse overgrowth of the tarsal covering, so that it may look like a plush pile, or be grossly studded with enlarged follicles Many cases are so little acute that there may be no outward symptoms of the disease save the slight ptosis, and in these the inflammatory process is dry and sluggish, and the harsh roughness of the tarsal membrane is marked

Whether or not corneal involvement is a necessary clinical character of the disease is a moot point Wilson[13] of Cairo thinks that it is Other observers do not admit this My own experience is that within the first year of the disease in children it is rare, and it may never appear if efficient treatment is begun early, but it is certain to appear in long-standing cases, especially among adults

The disease is undoubtedly highly contagious Doctors and nurses have been infected, and inoculation experiments have been done Perhaps the most dramatic account of an experimental inoculation is that recorded by Treacher Collins[14] in his account of the London ophthalmia schools Children were loath to leave the lovely country schools to go back to the old-time town barrack schools, and deliberately irritated their eyes to prolong their treatment

"One child, whose name peculiarly enough was Sly, was admitted with marginal blepharitis and slight conjunctivitis, this was cured and all treatment was stopped preparatory to her leaving the school She was then caught by the nurse taking discharge from another child's eye who was suffering from trachoma and deliberately putting it into her own The symptoms of acute muco purulent ophthalmia rapidly set in, and two months later typical trachoma follicles on the tarsal conjunctiva were recognized After a year's treatment the trachoma was cured."

The most striking clinical feature of the disease is its chronicity From six months to two years is its usual duration, and most cases extend to the longer term So strongly is this impressed upon me that I am critical of my own or of others' diagnosis when a case of suspected trachoma reacts speedily to treatment!

The histological feature of the changes produced by the disease is the extraordinary proliferation of the lymphoid tissue There is a diffuse lymphocytic infiltration of the conjunctiva with numerous follicles occupying the subepithelial layer A follicle may measure from 0 5 to 2 mm in diameter The periphery of a follicle is formed of layers of lymphocytes, in the central area are many large mononuclear cells All the changes are most marked in the retrotarsal fold, but no part of the conjunctiva is exempt The beginning of a cure is shown by the breakdown of the centres of follicles and the gradual growth of connective tissue fibrils around the follicles In advanced stages the fibrosis is so extreme that the follicles are strangled by the shrinkage of the scar tissue Success in treatment is shown in a fine even spread of the scarring Failure is shown by a gross unequal scarring and consequent distortions of the lids with all their painful and disabling effects I am inclined to the view that the worst end-results are sometimes due more to ill-advised severity of treatment than to the effects of the disease

The Causes of the Disease

The control of trachoma needs a knowledge of its cause and of the conditions under which it spreads The primary exciting cause of the disease is as yet uncertain There is a general agreement that it has the characters of a distinct entity, and such that it may certainly be ascribed to some virus There is no doubt that its progress is affected by intercurrent infections, but none of these infections, which are common and well known, appears to be the determining cause From the days of Koch's investigation of the disease in Egypt in 1883 there have been many attempts to identify specific organisms So far no claim has been established The most recent work is that of Noguchi,[15] a piece of experimental investigation of much promise His *Bacillus granulosis* is described as being present in the affected tissues in extremely small numbers in the vicinity of the small and large mononuclear cells constituting the follicles It has been isolated in cultures, then it is found to have a single polar flagellum The cultures have been inoculated into monkeys, and have induced conditions of granular conjunctivitis apparently identical with trachoma in man Wilson[16] of Cairo has published the report of an investigation he has made on the lines of Noguchi's work His results are indefinite

If the primary cause of the disease is uncertain there can be no doubt of some of the *adjuvant* causes These are conditions of life which can be dealt with Trachoma is rarely found except among people of low standards of living It is found among squalid people who are herded together In these conditions there is a common neglect of what we speak of as sanitary rules, but which may be better described as the rules of civilization The easy communal generosity of the feckless has often been noted Unfortunately this liberality extends to the use of sanitary articles which in more developed communities are regarded as strictly personal It is, I believe, to the careless but pernicious generosity of these people that the ready dissemination of eye disease among them is due When once the distinction of *meum* and *tuum* in regard to toilet articles has been learned there is a distinct rise in the standard of cleanliness, and therewith a lessened risk of communicable disease I have known outbreaks of acute conjunctivitis in schools coincide with the breach of the rule of separate towels, and in no case have I known an outbreak spread where there was a strict re-enforcement of the rule Confirmation of this observation may be obtained in the care of the men of the Chinese Labour Corps in France These men at all times carried about their person a towel which was used for many purposes It was freely loaned to companions Lister found it necessary to arrange for a regular sterilization of these towels, and he was certain of the efficacy of this procedure

London Schools

In former days the chief breeding places of trachoma in London were the Poor Law schools The children of destitute families were drafted into huge barrack schools These schools were ravaged from time to time by epidemics of ophthalmia, which was always endemic Stephenson,[17] in an historical note, showed that the evil of these schools was known as early as 1848 In 1858 Bowman made recommendations regarding them Ten years later similar recommendations were made by George Critchett Nettleship in 1874 inspected all these schools, and of one he stated that "not 15 per cent of the eyes could be described as healthy" A report in 1888 by Littlejohn, the medical officer of one of the schools, in which he said "Children have contracted the disease in the school to an appalling extent," attracted the attention of Parliament An isolation school for ophthalmia was provided under the care of Sydney Stephenson From later London reports I find that the separate attempts of the local London Poor Law authorities were amalgamated by the Metropolitan Asylums Board Two ophthalmia schools were established in the country north and south of London in 1903 and 1904 in charge of Treacher Collins At the time of the foundation of these isolation schools the average number of children housed in the Poor Law schools was 10,800 The accommodation of the isolation schools was 720 In the first year 625 children were admitted, of whom 292, or 46 7 per cent, were suffering from trachoma The segregation of affected children was so efficacious that in 1918 there were only 186 entries, so one of the isolation schools was closed In 1921 there was a risk that the other would be closed too for lack of cases It was therefore determined to admit children also from the elementary schools Even with this far wider field from which to gather patients the demand upon the resources of the school at Swanley has been below the accommodation In January, 1930 only 253 of the 350 beds were occupied Thirty-nine were pauper children

gathered from the Poor Law schools with a roll of 6,375 children, 12 were cases from outside London, and 152 were elementary school children Of the total cases 67 were trachomatous, or 26 5 per cent

A most effective agency in the control of trachoma is the School Medical Service For the past twenty-five years I have been intimately connected with this work in the County of London My duties as ophthalmic consultant include work at a consultation centre at the County Hall, to which are referred children whose sight presents special difficulties in education or medical treatment

By Act of Parliament the education authority is responsible for the medical inspection and treatment of the school children The schools are visited regularly and all the children examined in specified groups Those requiring treatment are referred to their home doctors or to school clinics maintained by the authority Parallel with this arrangement there is the School Attendance Department which has the duty of investigating the reasons for the absences of children from school Absences of more than a specified period are reported to the head office for special investigation This dual organization within and without the schools ensures a very complete supervision of health of the children

The efficiency of the organization was well demonstrated a few years ago Early in 1924 an unusual number of absences from school on account of "external eye disease" were reported by the attendance officers in the Thames-side districts of Poplar and Stepney A batch of the affected children was brought to the consultation centre at the head office I found them to be suffering from early and acute trachoma Thereon all absentees and the other children of their families and also the children of the schools they had attended, were medically inspected A definite epidemic of trachoma was discovered among the children of a few schools in the poorest quarter close to the docks. Ordinarily cases of trachoma average a score a year for the whole school population of London In this year, 1924, the numbers seen were January, none, February, none, March, 17 April, 34, May, 51, June 36, July 51 August 2 September, 4 October, 4 November 10, December, 6 making a total of 215 cases The affected children were transferred for treatment to the Swanley Ophthalmia School now under the direction of Stephen Mayon, with the most satisfactory results The epidemic was confined to the original area of its outbreak and ceased at the end of the year I have heard some hard savings about the school attendance officer It has been asserted he is as hard hearted as the pedagogue of a familiar Pauline argument but his strictness is an invaluable safeguard to the children as was demonstrated in this outbreak Imagine what might have happened in densely populated London if there had been no inquisitorial attendance officer

War Conditions

An example of large-scale prevention and treatment is recorded by the ophthalmic surgeons' s detailed during the great war for oversight of the Labour Corps Large numbers of coloured men were brought into France for labour purposes Trachoma was rife among them It was recognized that with the proximity in which the individuals of the Labour Corps had to live there was a danger of trachoma becoming universal throughout these units Had this occurred their capacity for work would have been greatly impaired and there would have been a risk of the disease spreading to the British troops and to the French population

The Egyptian labourers were highly affected At a low estimate 45 per cent were either suffering from or had had trachoma Of the South African Cape boys only 3 per cent were affected The main problem was with the Chinese of whom there were roughly 100 000 The incidence among them was 8 per cent—that is about 8 000 cases besides these there were 5,500 cases of suspicious conjunctivitis

The steps taken to remedy matters were three (1) instructions were given that no labourers with trachoma should be recruited from abroad and for those on the voyage sanitary treatment was given (2) the affected men were segregated, (3) treatment was given to both the affected and the "clean", the latter received zinc drops, and their towels were sterilized regularly The effect of these measures was speedily apparent in the improved condition of the men and of their work

Conclusions

The evidence presented in this paper points to two certain conclusions (1) that trachoma can be controlled (2) that the control of trachoma is a practical proposition The measures requisite to this control may be viewed from two points that of the country where the disease is endemic, and that of the country free from the disease It will be agreed that the principal condition favourable to the spread of trachoma is squalor, the product of bad social conditions If we can raise the social status of a community the risks of communicating trachoma will be reduced until they are small—as in England Social conditions can rarely be effectively altered by outside influences, but this can be achieved if the influence works from within the community There is now scarcely a country in the world that does not maintain some sort of system of elementary education for its children Where there is such a system there is ready to hand the basis upon which an efficient campaign against trachoma can be waged The recognition that a school for children is a place for the training of the child in the use and care of its body, as much as for the training of its mind, will make the school the most efficient prophylactic against contagious eye disease Instruction in the care of the body engenders pride of body, and this in its turn fosters a sense of separateness or fastidiousness which is offended by a community of interests in toilet articles That lesson is, I believe, one of the chief gains of civilization, without it our cities would be pest centres, instead of ranking with health resorts It would do more to extirpate trachoma than any other measure It would create in countries where trachoma is rife the demand by teachers and parents for routine examination of the eyes of children on entry to school at specific intervals, and of suspects at all times Experience in London shows how readily medical inspection, at first resented becomes demanded as a safeguard to all parties—the child its family and the teacher

Discovery of disease demands treatment Isolation ophthalmic schools such as Swanley are an economic proposition in countries where the incidence of trachoma is low where it is high such measures are impossible But it is possible to provide local dispensaries and travelling hospitals after the type of the beneficent foundation of Sir Ernest Cassel in Egypt Further it will be good practice to provide for the issue to the people generally of zinc sulphate drops Regular and long-continued use of these drops in residential schools I have found safe and of value There is evidence of their value in the control of trachoma among the coolies of the Labour Corps in France Davidir in Palestine records that during a local epidemic of ophthalmia the school children were unaffected so long as they used the drops but they fell victims to the attack when their use was stopped Maybe there would be a few cases where intraocular inflammations would be injuriously affected by the use of the zinc drops but even with that risk in view I think the universal use of the drops would be justified in a trachoma ridden country Finally in such countries there should be a rule reserving appointments to posts in the public services to the healthy and disqualifying candidates with trachoma There can be no doubt that such a rule would furnish an effective sanction in a campaign against trachoma

In a country where trachoma is rare there will be a justifiable demand for the exclusion of immigrants suffering from the disease In these days of widespread travel the risk of entry of communicable disease into a clean country is great Quarantine is no service in the prevention of trachoma The disease is too enduring Exclusion is the proper remedy There have been at various times outcries against the action of some countries in rejecting immigrants for failure to attain standards or health In my view stringent rules as regards health are wholly justified both for the safety of the one country and for the improvement of the other The fact that trachoma will exclude the immigrant in any country will do much to awaken the

authorities of a trachoma-ridden country to the disability under which its nationals labour, and to the necessity for remedial measures

In conclusion, I would venture to reiterate my belief that the best line of attack is through an efficient school service Through this we can get an oversight of the children such as no other means will secure The school also tends to inculcate a sense of personal responsibility that is invaluable to the common health There is no doubt that if we could keep the children of one generation free from the disease trachoma would be extinct

SOME IMMUNOLOGICAL PROBLEMS IN SEPTICAEMIA.*

BY

FRED T CADHAM, M D,

PROFESSOR OF BACTERIOLOGY, UNIVERSITY OF MANITOBA MEDICAL SCHOOL

WHEN pyogenic micro-organisms overcome all defences of the body, travel freely through, and even on occasion multiply in the blood stream, giving rise to symptoms of a general invasion, the condition is recognized as septicaemia Any definition of the term, however, is apparently subject to modification, for instance, with the extension and perfection of blood culture methods, micro-organisms may be recovered from the blood in many states, such as typhoid and pneumonia, which are not classed as septicaemia Then, too, disease entities exist in which the evidence suggests that there is a general invasion of an ultra-microscopic organism or virus The diagnosis of septicaemia, then, rests not alone on laboratory procedures, but depends also on the clinical evidence For this discussion I will consider the type of case in which the symptoms of a general bacterial invasion overshadow those of local origin, and which is characterized, clinically, by chills, sweats, irregular temperature, and is associated with the finding in the blood stream of the causative micro-organism, generally a pyogenic coccus, most frequently a streptococcus In the treatment of such cases the physician turns for help to the immunologist

The origin and outcome of such a condition depend naturally, on the two interdependent variables—the infective agent and the patient's resistance

THE INFECTIVE AGENT

Briefly let us consider the invasive power inherent to the micro-organism What is the influence of numbers? We know that a measured quantity of a certain microbe may at times be required to induce a septicaemia, yet, clearly, it is not the determining factor, for the few streptococci driven into the tissues and the lymph channels by the prick of a needle may initiate a rapid and fatal type of the disease, while on the other hand a massive infection frequently remains localized That the power of elective localization of bacteria has an essential bearing on the question has been clearly demonstrated by Rosenow Even so, in elective localization the variable factor is in evidence, for a meningococcic infection occasionally exists only as a septicaemia, with no clinical or pathological evidence of any particular involvement of the meninges Again, the *Streptococcus viridans* may invade the heart valves, which indicates that the microbe passed through the blood stream unaffected by the defences of the body, and possibly without giving rise at the time to clinical manifestations of its presence in the blood, subsequently a septicaemia arises from the endocardial focus

An overwhelming invasion following the inoculation of a few organisms suggests that the circulatory system may be the elective site, for it is not unusual in some cases to find scant evidence that any particular tissue is involved, even though the micro-organisms may be noted in direct blood smears Besredka, however, emphasizes the importance of tissue immunity at the primary site of elective localization, according to his theory a general invasion of the staphylococcus or streptococcus indicates a previous cutaneous or mucous area of infection

The capacity to produce powerful toxins, to multiply rapidly, or to resist destruction is peculiar to certain bacteria Such factors determine aggressiveness, while just as important, evidently, in favouring a continued bacteriaemia, is the inability of the causative organism to incite antibody production

As a rule bacterial association favours a local infection, but that it is, in septicaemia, an important factor receives slight support, however, a simultaneous general invasion of more than one micro-organism may occur Further, while one grants that septicaemias may be induced experimentally by the inoculation of a single selected strain of an organism, such as a streptococcus, yet the evidence shows that no single strain is responsible for all streptococcic septicaemias Here, in carrying out agglutination tests with forty-five strains of streptococci recovered from as many cases of septicaemia, we failed to obtain any common agglutinative type

Virulence as associated directly with the microbe lacks definition More recent work, such as that of Falk, stresses the theory that the dynamics of the electro-potential differences of the cells underlie some of these problems For the further elucidation of the term virulence as related to the micro-organism, Holman suggests more intensive physiological studies of the metabolism of bacteria These factors are bound up with the structure of the microbe, how infinitely complicated this may be one can judge from the fact, as Cameron illustrates, that a comparable unit, such as a red blood cell, contains approximately a million million molecules and ions

I have touched only on some of the principal characteristics of the micro-organism which are believed to determine its invasive powers, for aside from preventive measures, the nature of the microbe which infects the patient and produces a septicaemia is the accidental factor over which the physician has no control The attenuation of the virulence of an infective agent by world wide measures such as universal vaccine therapy is a problem not yet solved In Winnipeg the incidence of septicaemia caused by the haemolytic streptococcus shows periodic waves, suggesting the prevalence at intervals of a type or types of this streptococcus favouring such an infection

THE PATIENT'S RESISTANCE

The rapid spread of an infection from a small focus indicates primarily an inability of the phagocytes, other leucocytes or plasmatocytes, to cope with the infective agent A determination of the opsonic index in such cases frequently shows that the blood is deficient in natural opsonins These opsonins when present facilitate phagocytosis until such time as the body responds with the production of specific antibodies, including the thermostable opsonins, for the bacteria and their products responsible for the infection

This weakness in the defence, which allows the extended invasion of some bacteria particularly the pyogenic cocci, the haematopoietic tissue may attempt to offset by increased production of leucocytes (It is characteristic of the case

* Read in opening a discussion in the Section of Bacteriology Pathology Physiology and Biochemistry at the Annual Meeting of the British Medical Association Winnipeg 1930.

of septicaemia in the series we investigated that an increasing leucocytosis paralleled a low opsonic index and a fall in complement The frequent failure, however, of such a leucocytosis to overcome the infection suggests a more intensive effort on that ever recurring problem—the early transference of specific immune bodies to such patients

The production in the individual of specific antibodies to the infective organism requires time, the formation of such antibodies for the endotoxins and the bacterial substance postulates a previous dissolution of the bacterial cell A haemolytic streptococcus or a staphylococcus invasion may progress with such rapidity that death occurs before the lysis of a sufficient number of bacteria takes place that would stimulate the production of the necessary antibodies Such an argument, of course, does not take into account the elaboration of antitoxins for those exotoxins that the microbe may produce Even so, the development of such antitoxins frequently requires more time than the urgency of the patient s condition allows A *Streptococcus viridans* infection on the other hand, will persist in the heart valves for months, with just enough production of antibacterial substances to limit the subsequent general invasion to an intermittent bacteriaemia

Should a sufficient interval of time elapse for the development of a leucocytosis and the elaboration of antitoxins, and of agglutinins, precipitins, opsonins, and lysins, without evidence that the patient is overcoming the infection then, two factors in resistance, based on current concepts of immunity, may be especially considered First, that there may be a possible failure in antibody production, and second, that, even if such are elaborated, the body cells and fluids may fail to utilize them for the destruction of the micro-organism or the neutralization of the toxins The failure in bacteriolytic action may result, in part, from a deficiency in complement, that property of the blood serum which the fundamental researches of Ehrlich and Bordet showed was essential to complete the lysis or death of bacteria in the presence of the immune body

In this discussion I wish to dwell particularly on the *influence of complement in septicaemia, a discussion which* at once involves us in a consideration of the relation of complement to health and disease

Complement in Health

Complement, as a substance or state of the blood serum, exists, so far as we know, in all normal individuals I have found but slight variation in the titre of complement in the serum of *the blood taken from 500 persons in normal* health, and under normal conditions This power of complement was determined by its action against sensitized sheep cells However, a slight diurnal variation was noted, approximately a 10 per cent increase occurred in the titre of the specimens of blood taken in the evening compared with those taken in the morning The finding of a low complement power in a supposedly healthy person suggested disease or the results of disease, subsequent careful clinical examination of these persons proved this assumption to be correct The results obtained indicate that complement is an attribute of health, further support of this statement is supplied by Huntemueller, who, following investigations on Olympic athletes states that a fall in complement titre of the blood serum occurred in overtrained competitors, but such did not occur in those who were in perfect condition, even after sustained exertion

While it was thought that the blood of all normal animals contained the usual amount of complement characteristic of the individual species, yet there has been reported the existence of a race of guinea-pigs which showed a deficiency of this quality in the blood serum Moore pointed out that these guinea-pigs were less hardy than the normal animal, and that their opsonic index was about one-half normal Coca determined that it was the third complement component, the heat-resistant or yeast-absorbed component, which was missing and Hyde reported the arresting fact that this characteristic of the serums of these guinea-pigs was inherited as a simple recessive Mendelian unit Pertinent to the discussion is the fact that the deficient serum or plasma could be activated by very small amounts of serum from man or normal guinea pig *in vitro* or *in vivo*

Complement in Disease

Is it not important to recognize that the complement property of the blood varies widely during disease? In 1914 Gunn noted these changes in *cases of typhoid,* diphtheria, and scarlet fever Our investigations in part previously reported, of over one thousand patients, also showed that this *property, as tested by the haemolytic* system with sensitized sheep cells, varied from an increase of 20 per cent *over normal to a complete absence, depending* upon the *nature, location,* and *stage of the disease* As a rule these fluctuations follow a uniform course commonly there is a slight increase in complement coincident with the onset of the symptoms of the disease, this is *followed by* a steady decrease until the infection reaches its maximum, during convalescence complement gradually returns to normal However, in some cases, the complement property of the serum gradually decreases until no evidence of its presence, unless reactivated, can be observed by the use of the haemolytic system These latter cases as a rule terminated fatally, but exceptions were noted

More recently Hadjopoulos and Burbank *in an extensive* series of investigations on the blood of persons in health and disease, arrived at similar conclusions, while Goldner stresses the association of a decrease in complement with those infections which interfere with liver function

We observed that, as a rule, patients with chronic diseases such as tuberculosis, syphilis, chronic arthritis, uncomplicated malignant disease goitre and diabetes showed but slight oscillation in the complement titre of the blood serum However, in a patient with an acute infectious disease, and particularly septicaemia, the fall in complement titre following the initial rise, was rapid, and in the fatal cases, occasionally a complete absence as determined by the *method of investigation described* was noted

What component of complement is missing in the serum obtained *from the patients with these diseases I have not yet been able fully to determine, but a slight reactivation* 10 per cent , occasionally occurs on the addition of heated *normal serum while an average of 20 per cent reactivation* was obtained by the addition of that inactivated by ammonia In some instances a slight reactivation was noted following the addition of serum which had been inactivated with a bacterial culture, yet if the blood of a patient with streptococcic septicaemia showed deficient *complement, practically no reactivation could be obtained* by the addition of normal serum which had been inactivated by previously mixing such serum with the specific streptococcus *Muir and Browning however have shown that the* removal of the natural bactericidal power of normal serum by treatment with dead bacteria may leave the haemolytic power of complement unaltered

The recognized necessary part played by complement in the *antibacterial action of blood in vitro raises the question* of the influence of this property in the circulating blood Long ago Muir emphasized the importance of this factor in immunity, and the dependence on complement of the opsonic action of normal serum Then too that complement exists in the blood plasma in proportional amounts to that *noted in the blood serum* has been shown by several investigators (Kolmer) and Hyde has demonstrated the action of haemolytic *complement for foreign erythrocytes* in the circulatory system of the frog

The dependence on complement of the opsonic action of normal serum suggests that this property exerts some influence on the susceptibility to infection but to what extent has not been established However the necessary part played by complement in bactericidal action in conjunction with antibodies indicates that it is an *important* factor in *determining* the limits of an infection It is logical to infer if not to state from *the available evidence* that a high complement titre in the blood of a *patient with* septicaemia aids materially in overcoming the infection

Complement in Treatment

How may the treatment of *septicaemia* be influenced by deductions drawn from these observations? Small amounts of normal serum even at times one-quarter of 1 per cent , will activate blood deficient in complement both *in vitro* and *in vivo* I have determined that the addition of small

amounts of normal serum would reactivate serum obtained from a patient's blood which was deficient in cytolytic activity, in patients showing a deficiency of complement resulting from infection, reactivation occurred following transfusions of small amounts of serum derived from the blood of normal persons or animals This reactivation is immediate, and lasts, as a rule, two to three days, when the serum tends again to show a deficient complement titre, provided the infection which caused the original loss in complement has not abated

In view of these findings it appeared logical to give repeated transfusions of small amounts of serum from the blood of a normal compatible donor to patients with septicaemia It may be suggested that transfusions of whole blood would have accomplished the same purpose Small whole blood transfusions do activate complement *in vivo*, but with this difference—that the decrease in complement titre which frequently again occurs about the third day is considerably more marked than that which follows transfusions of serum

As regards massive normal blood transfusions for sepsis, I have observed in three patients who received such treatment that subsequently a severe loss of complement occurred by the third day, a greater loss than would be expected as the result of the infection, and within a week the complement titre of their blood serum had dropped 20, 40, and 50 per cent lower respectively than before such transfusions were made Consideration must also be given to the problem, as suggested by Wright, that such whole blood transfusions may furnish a pabulum which aids the further multiplication of the infective bacteria

Antibody and Complement

We found in patients with sepsis that the relation between antibody and complement followed a general rule—namely, if the patient failed to improve, and the blood showed a high complement titre, then the antibacterial content of the blood for the causative micro-organism was low, and conversely, in such patients, if the antibody content of the blood was high then the complement titre held to low values The immune content of the blood for the specific infection was determined by the agglutination reaction, and by complement fixation

Provided the complement is normal or is raised to a normal power, then to complete the destruction of the infective micro-organism by bacteriolytic action, and to facilitate phagocytosis, specific antibodies are deemed essential Yet the preparation of a specific immune serum for those organisms most frequently connected with septicaemia has always offered a problem of the greatest difficulty

The frequent failure of the administration of an anti-streptococcic serum to benefit the patient in a case of streptococcic septicaemia is generally held to be the result of an absence in the serum of essential antibodies The animal from which the serum was derived may have been immunized by a different strain of the micro-organism from the one responsible for the infection in the patient In an attempt to overcome the latter difficulty we inoculated rabbits with separate vaccines and toxins prepared from over fifty strains of streptococci and staphylococci recovered from as many different patients with septicaemia On experiment these animals became highly resistant to induced infection

Further, Gay points out that the evidence indicates that the reservoir for antibody production is in the cells Again, experiment shows that a specific stimulus, such as the inoculation of a vaccine, causes the appearance in the blood of homologous antibodies, if such are present in the tissues Then, too, success in the treatment of septicaemia has been reported following transfusions of blood from a donor who had been previously inoculated with the specific organism Sir Almroth Wright outlined the immunological factors involved in such a procedure, and the method has been further developed by Colebrook and Storer I have applied these principles in an endeavour to increase the antibody content of an immune animal serum, which was to be used in the treatment of septicaemia One of the rabbits which had been previously inoculated as before described, with some fifty strains of streptococci and staphylococci, was re-inoculated with a broth culture containing the specific strain of the organism obtained from a positive blood culture, and several hours subsequently 8 to 10 c.cm. of blood were withdrawn from the rabbit's heart under aseptic precautions The serum of such blood frequently gave a high agglutinative titre for the specific micro-organism with which the animal had been inoculated several hours previously A further procedure was to inoculate rabbits on alternate days with a vaccine and toxin prepared from the microbe isolated from the blood of the patient If the course of the disease allowed for a sufficient interval of time to elapse for these rabbits to have developed specific antibodies, the serum from the blood of such animals was also used Cardiac puncture apparently causes the animals no harm

Treatment with Normal and Immune Serum

We have treated with serum 56 patients who were suffering from septicaemia, the majority were in an advanced stage of the infection, and with these this method of treatment was adopted as a last resort Forty-five recovered. Blood cultures showed in 38 cases a haemolytic streptococcus, in 6 a *Streptococcus viridans*, in 5 a staphylococcus, in 1 an unidentified diplococcus, in 1 a colon bacillus, in 3 both a streptococcus and a staphylococcus, and in 1 a staphylococcus together with the *Bacillus pyocyaneus* Each case in which blood cultures indicated a double infection proved fatal

The following method of treatment was adopted A compatible donor reported at the laboratory From 60 to 70 c.cm. of blood were withdrawn from a vein in the arm into a large sterile vacuum tube The blood was allowed to clot at room temperature, then placed in the ice chest Five to eighteen hours subsequently the serum was drawn into a sterile glass syringe, and then the patient was transfused with this serum These transfusions were given every second day, four of such treatments constituted the average number given to a patient On alternate days 2 to 5 c.cm. of immune serum from a rabbit, prepared as previously described, were inoculated subcutaneously It needs to be pointed out here, however, that the extended therapeutic use of rabbit serum has obvious limitations, the animals are small, comparatively short-lived, and susceptible to certain infections

This method of treatment does not contraindicate the search for foci, and surgical intervention for the elimination of the same when such a procedure is feasible Moreover, it is recognized that the nature of septicaemia varies widely, and a patient with apparently an overwhelming bacterial invasion may recover without special therapeutic aid, hence the value of any particular method of treatment, judged by clinical results, is open to discussion Besides, as suggested by Churchman in a masterful review on the intravenous use of dyes, thought needs to be given to the possibility that attempts at rapid sterilization *in vivo* may defeat their own purpose, serious results may follow the too rapid absorption of freed endotoxins

OTHER FACTORS

While one may stress the value of complement and antibacterial substances generally as a part of the defensive mechanism against an extended bacterial invasion, yet the importance of any single factor naturally varies with the individual case, also with the numerous associated processes So interrelated are these that obvious difficulty arises in confining the scope of this discussion One would like to consider the absorbing questions of the origin and nature of complement and of the influence of diet and drugs on this property, or of the chemical nature of antibodies and their possible synthetic production Mention may be made, however, of the work of McIlroy and Greer in the treatment of puerperal septicaemia with vitamin A an evaluation of this work involves consideration of both the physiological and the biochemical relation of vitamins to immune processes Then, too, the beneficial results occasionally obtained in sepsis, following the use of scarlet fever antistreptococcic serum touches the key question of the relation of the toxins from the various strains of streptococci to one another Also of arresting interest are

the observations of Gay suggesting either the possible mobilization or passive transfer of the tissue macrocytes In addition the influence, however uncertain, of the bacteriophage demands attention, in five of our series of cases it was noted that following treatment the specific organisms were undergoing bacteriophagy recovery occurred in these cases In four cases with a fatal termination when it was possible to obtain the organism from a focus there was no evidence that a bacteriophage for the causative bacteria was present According to d'Herelle if a bacteriophage for a micro-organism causing infection is active in vivo, then the prognosis becomes more favourable

It must not be overlooked that some cases of septicaemia offer little hope from the therapeutic standpoint The destruction of tissue in scattered lesions caused by direct bacterial action is frequently beyond functional repair especially does this apply to lesions in the brain or heart Particularly, an infection engrafted on a previously injured heart and giving rise to a septicaemia generally signifies a permanently damaged endocardium resulting in cardiac incompetence that no method of therapy based on immunological studies will rectify This latter problem suggests some other method of approach and since a subacute bacterial endocarditis with an associated bacteriaemia is prone to develop in an individual with valvular lesions then the possible prophylactic immunization of a person with a damaged endocardium by means of a polyvalent streptococcus vaccine deserves consideration

Immunity problems of septicaemia naturally concern all the sciences represented in this Section of the Annual Meeting possibly correlation of the results obtained through the various lines of approach, either clinical or experimental, may furnish some solution Admittedly, up to the present, the clearing hewed out of the gloom of immunology by Pasteur, Ehrlich, and their disciples has been well and hopefully tilled, only to produce in septicaemia, limited therapeutic results The quickening light afforded by the efforts of those early workers now becomes shaded with the growing clouds of doubt, and some predict barren returns from further efforts in that field They say we must seek or make new clearings In advancing some of these problems for discussion to-day it is with the hope that the old furrows retilled or possibly the turning of a new furrow, may prove the field still fruitful

THE PLACE OF PASTEURIZATION IN A SCHEME OF MILK DISTRIBUTION*

BY

A S M MACGREGOR, M D EDIN D P H,

MEDICAL OFFICER OF HEALTH GLASGOW

THE heating of ordinary milk during distribution is generally admitted to be an imperative necessity and is in fact demanded by many city ordinances In other quarters pasteurization is looked upon as a temporary measure advisable under present conditions which it will in time be possible to discard like other methods of preserving milk and which will cease to be employed in proportion as highly organized and efficient methods of production and distribution become general Some nutritionists take a more positive view and think that the sooner this time arrives the better it will be for the consumers especially children Some of the evidence on which an opinion may be based is clear enough, in other respects, it is still in an experimental stage

My experience leads me to adopt the view that milk supplied in bulk for consumption in large urban areas should be submitted to pasteurization by approved methods the most powerful argument being that the menace of milk borne infections is thereby largely eliminated and is restricted to such relatively infrequent incidents as may cause infection during or subsequent to pasteurization Glasgow is no exception to the general experience that the increasing practice of this procedure has caused a corresponding decline in the capacity of milk to convey specific infection to the consumer The pasteurizing of milk is now applied to between 80 and 90 per cent of the city's milk while about 70 per cent of the supply is delivered in bottles The history of milk outbreaks of disease where the source of infection was at the farm is entirely concerned with this diminishing portion of unpasteurized milk in the city's general supply

As regards the history of pasteurization this process was first practised in Glasgow in the late nineties of last century when the flash system was introduced by the large distributors that is heating to about 160° F followed by immediate cooling Prior to this the scalding or scadding of milk (to use a Scotticism) was resorted to by immersing cans of milk in open boilers at temperatures of 160° F to 180 F and thereafter cooling in running water Subsequent to 1900 the rapid growth of the city demanded further supplies from greater distances and pasteurization became more and more extensively employed to enhance the keeping qualities of the milk The old flash system has been entirely superseded by modern methods a change greatly assisted by the educative effect of the Special Designations Order of 1923 the transition to the positive holder type of pasteurizing machine as recommended becoming practically universal There is a general reluctance to exceed a temperature of 145° F and the United States standard of 142° F is sometimes adopted

Pasteurization grew up and was widely adopted for commercial reasons as it augmented the keeping quality of milk It preceded but did not as was sometimes feared prevent the undoubtedly great improvements which have taken place in recent year in the standards of production of raw milk a large proportion (at least 70 per cent) of ordinary market milk being now comparable with that of grade A quality Those who are producing and retailing graded milk have made it clear that with proper control it is possible to produce and sell unheated milk successfully even in the poorer quarters of London This remark occurs in Research Monograph No 1 of the Ministry of Agriculture and Fisheries (1929), and might be applied to any city It is quoted to show the trend of progress in the domain of milk production and may be taken to mean that the argument of commercial necessity in support of pasteurization has lost much of its force except in relation to the transport of milk over long distances

There is no doubt that pasteurization of milk has added to the security of cities against the danger of milk borne infections This is a matter of great importance and the following local illustrations may be quoted from experience in Glasgow All the outbreaks of infectious disease whose source was traceable to farms were associated with supplies delivered direct and untreated from the farm to the consumer or formed that part of the supply of a particular centre of

*A paper read in opening a discussion in the Section of Preventive Medicine at the Annual Meeting of the British Medical Association, Winnipeg 1930.

distribution not subjected to pasteurization The following incidents are taken from the records of recent years

In 1912, a group of 19 cases of enteric fever on a milk supply delivered direct from farm to dairy was traced to a carrier at the farm. In 1927, an outbreak of 67 cases of paratyphoid B infection broke out on a similar direct supply Five of the dairy farm hands gave positive blood reactions and two of them ultimately admitted having had mild and trivial recent illness In 1913, there occurred 31 cases of scarlet fever due to a milker who had a mild sore throat and was not off work, she infected the dairy keeper with scarlet fever In 1916, a group of 11 cases of scarlet fever originated from a girl, aged 12 years, at the farm, preceded by two cases of "tonsil litis" without rash In 1918, a series of 19 cases of scarlet fever occurred on the early morning direct supply from a farm, the probable source being a suspicious sore throat in a girl milker at the farm In 1919, there occurred 32 cases of scarlet fever on a direct supply, the source of which was not definitely ascertained In 1923, a series of 23 cases of scarlet fever occurred on a farm supply traced to a missed infection in a child of the dairyman, who infected the milk during the convalescent desquamating stage of her illness In 1925, a group of 6 cases of scarlet fever occurred on a farm supply where a young child was found with double otorrhœa following an apparently undetected attack of scarlet fever In the same year, a series of 15 cases on a direct milk cart and dairy supply was connected with (*a*) scarlet fever in a farm labourer's child, and (*b*) otorrhœa following an unrecognized attack in one of the farmer's children As regards diphtheria, in 1913 a group of 13 cases originated from a child at a farm who had had no definite illness but whose throat harboured the bacillus In 1915, there occurred 115 mild cases in the neighbourhood of Glasgow, related to sores on the knuckles of three milkers and lesions on the udders and teats of eight of the cows One of the milkers ultimately developed diphtheria while "diphtheroid" bacilli were recovered from four of the cows and from the sores on the hands of the milkers In 1922, a group of 10 cases on a direct supply was traced to a milker with enlarged tonsils harbouring the bacillus of diphtheria There have also occurred two considerable and severe outbreaks of septic sore throat due to undetected mastitis in dairy herds In one of these, pasteurization of the supply pending full investigation cut short the outbreak

In all these instances the milk was delivered in its natural state, and was contaminated through the medium of an infected person on a farm supplying a local dairy in a suburban area No similar incident has occurred on the main pasteurized supplies of the city It has been pointed out that the purveying of milk is becoming concentrated in the hands of large distributors, supplies from numerous farms being mixed in wholesale fashion, so that the possibilities of spread from chance infections, such as those instanced above, would be greatly enhanced in the absence of an effective safeguard Infections occur with sufficient frequency on the comparatively small proportion of raw milk to make one wonder what would happen if the protection of pasteurization were removed When scarlet fever reached a high degree of prevalence three years ago, several patients were removed from dairy farms sending milk to the city from a neighbouring county

As regards the possibility of eliminating these risks by more effective public health control, it must be confessed that this is a matter of considerable difficulty The utmost precautions are defeated by such chance infections as those due to the very mildest cases of scarlet fever or diphtheria or paratyphoid fever, which are apt to be missed entirely What is called "a chance risk of infection from some accidental carrier" is a real risk in populous areas Many opportunities of infection occur among the personnel of farms in rural areas dotted with small townships and in proximity to a large city Farms are no longer isolated communities, transport makes it easy for farm servants and their families to mix with the general population, and when infectious disease is prevalent in the district the dairying community does not escape its share It is, in fact, far from being immune Epidemiological considerations do not suggest that the safeguard of pasteurization could be substituted for preventive control, however rigorously applied In times of epidemic prevalence of infectious disease and in the present circumstances of milk distribution in large areas, the source of an outbreak might have to be sought for among numerous farms The fact is that no one who is not in perfect health should milk cows or handle milk, so mild and elusive are the forms which infection may assume It would be extremely difficult for this standard to be reached by the several hundred individual farms supplying a large city

How much dependence can be placed on pasteurization in the prevention of tuberculosis and to what extent bovine tubercle bacilli may survive this process are difficult questions to which answers are being eagerly sought Investigations into the thermal death point of tubercle bacilli in naturally infected milk by L J Meanwell are referred to in the review of this subject contained in the Research Monograph of the Ministry of Agriculture and Fisheries issued last year In view of the importance of correlating the experimental results with the ordinary commercial practice of heating milk, the conclusions reached are worth quoting in full

"L J Meanwell carried out a long series of experiments in which he studied the thermal death point, at different temperatures, of *Bacillus tuberculosis* in naturally infected milk, and has published his results In addition he has made an epitome of his own work and that of other people from which the following conclusions are drawn

"First, that Meanwell himself carried out 39 experiments, in which naturally infected and apparently normal tuberculous milk was heated to 145° F for 30 minutes, and found living tubercle bacilli present on one occasion In a second series of 10 experiments he heated naturally infected tuberculous milk which did not appear to be normal to the same temperature for the same time and again found living tubercle bacilli on one occasion Secondly, that an epitome of recent work upon this subject demonstrated that of the four workers who employed naturally infected milk for their experiments three found living tubercle bacilli after heating the milk to 145° F for thirty minutes Thirdly, that negative results were obtained by those workers who employed cultures of tubercle bacilli or pathological material which required chemical treatment before it could be inoculated Fourthly, Meanwell's work demonstrated that tubercle bacilli in naturally infected milk which had been heated to 140° F for twenty minutes were usually destroyed, but that this combination of time and temperature left no margin of safety

'Meanwell finally concluded that commercial pasteurization of milk at 145° F for thirty minutes, when efficiently carried out, is usually effective in destroying the tubercle bacillus, but that milk subjected to this process cannot always be guaranteed to be entirely free from this organism, especially when one takes into account the fluctuations in temperature, possible mechanical defects in the plant, and the natural desire to hold the milk at as low a temperature as possible in order to conserve the cream line These factors are all liable to be present when working under ordinary conditions"

It therefore appears that, from an experimental point of view, pasteurization is effective in destroying tubercle bacilli in milk in proportion to the efficiency with which it is conducted The question arises whether the positive holder method of heating milk, which, if carefully applied fulfils the time-temperature conditions laid down, and which is now universally employed, does in fact constitute a safeguard against infection Definite positive evidence on this point would be difficult to obtain On the epidemiological side, there are certain suggestive features about the remarkable decline in the incidence of non-pulmonary tuberculosis which lend support to the view that pasteurization may have been a far from negligible factor

During the last twenty years the death rate from non-pulmonary tuberculosis in Glasgow has fallen much more rapidly than has the corresponding rate for tuberculosis of the lung Tracing the former rate since 1915, it is found that the decline in abdominal tuberculosis—that is, that form of the disease which is generally accepted as being caused by the bovine bacillus—has proceeded at an accelerated rate as compared with disease of other organs Contrasting the five yearly periods 1915 19 and 1925 29, the total decline for all ages is from 59 to 30 per 100,000 of the population or 49 per cent, while for the three constituent groups of tuberculosis combined, the fall is from 21 to 10 (47 per cent) tuberculous meningitis, abdominal tuberculosis, and other forms of tuberculosis respectively Taking the age period under 1 year, the fall (46 per cent), 17 to 7 (59 per cent) and 19 to 10 (47 per cent) in abdominal disease is from 106 to 22 (79 per cent) in tuberculous meningitis from 177 to 80 (55 per cent) in other forms 41 to 21 (49 per cent) For children between 1 and 5 years, the fall is respectively 65 per cent, 36 per cent and 60 per cent There has thus taken place a decided reduction in the incidence of fatal non-pulmonary tuberculosis a fact which is also associated with an increasing mildness in its various clinical manifestations It will be observed that the decline in the abdominal form especially at the younger ages, has been outstandingly rapid The figures should however, be accepted with some reserve, owing to the fact that in children, especially infants under 1 year, infection

may readily arise in death certification as between abdominal and meningeal tuberculosis both of which may be manifestations of a generalized tuberculous infection

It is clear that some powerful protective influence has been at work the nature of which can only be surmised As regards abdominal tuberculosis this affection has become more difficult to recognize and more amenable to treatment while tuberculosis of the glands of the neck also regarded as mostly a product of the bovine bacillus has markedly declined in incidence and severity This reduction in bovine infections cannot be definitely ascribed to any particular underlying cause, but, in the absence of a satisfactory alternative explanation it appears to me that pasteurization should be included among the likely factors and that public health administration should for this reason support the efficient pasteurization of ordinary market milk excluding of course the designated milks from duly attested and inspected herds

There is however another and highly important aspect of the matter namely the relative value of raw and heated milk as an article of food especially for children Little is known about the chemical changes which take place in milk heated to comparatively low temperatures although certain suggestive observations have been made indicating that pasteurization may assail the delicate nutritive qualities of raw milk to a material degree and that fresh milk of high quality from accredited herds is best for young children Such evidence as exists is conflicting but should it be clearly demonstrated that pasteurization deprives milk of an essential constituent there will arise the question of a radical change of policy in milk distribution in the interests of the young

In conclusion the systematic pasteurization of ordinary market milk intended for consumption in large urban areas is in my opinion unavoidable under present conditions where milk is collected and mixed from widely scattered and varied sources not under such scrupulous control as to eliminate the risk of chance infections—a danger which experience shows to be very real It is difficult to resist the view which is supported by experimental evidence that efficient pasteurization is of real protective value against bovine tuberculosis and that this practice could not be dispensed with until tuberculosis in dairy herds has been reduced to a minimum

THE EARLY DIAGNOSIS OF INFECTIVE LATERAL SINUS THROMBOSIS*

BY

FRANCIS MUECKE CBE, FRCS

SURGEON EAR NOSE AND THROAT DEPARTMENT LONDON HOSPITAL
CONSULTING SURGEON LONDON COUNTY COUNCIL.

INFECTIVE lateral sinus thrombosis has for many years been one of the most dreaded complications of suppurative middle ear and mastoid antrum disease The very high mortality resulting from this condition has of late years been largely reduced owing to the gradually increasing knowledge of the earlier symptoms and consequent earlier surgical intervention so much so that the prognosis may now be said to be distinctly favourable in all cases of operation previous to the breaking up of the infected clot

I have thoroughly examined the notes of the last hundred cases recorded at the London Hospital and it is remarkable how seldom I have found the more serious or later symptoms such as rigors and alterations of the central nervous system mentioned in the notes of the more recent cases the mortality also has dropped over 50 per cent in the last ten years It is therefore of the greatest importance to the patient that the earliest symptoms should be most carefully investigated

Of the 100 cases, 44 were associated with acute aural conditions (six months being taken as the acute period) and 56 with chronic suppurative aural condition Six of these cases were admitted to and eventually diagnosed in the medical ward and one remained undiscovered till the post mortem examination The admission diagnoses were pneumonia 2 pyrexia of unknown origin 3 typhoid 1 and septicaemia

It appears that children are more liable than adults in the proportion of three to one, and males than females in the proportion of two to one

Aural discharge previous to admission is almost universal only 5 of the acute cases having no discharge among the chronic cases 9 are noted as having no apparent discharge though a history of previous discharge was obtainable in all of the cases

Herpes and sordes about the lips and gums are extremely common symptoms and were present in almost all the cases I consider this to be a very early indication

Severe general malaise is another almost universal symptom of lateral sinus infection It is probably the earliest of all In only 3 cases was a positive blood culture obtained out of 42 cases where mention is made in the notes Examination of the state of the blood does not help diagnosis, as mastoid infection alone would give similar results

Downey's spinal test is only of value when the sinus clot has completely formed and is of no assistance in the early stages

Pain about the ear is another almost constant symptom in only 2 of the acute and 8 of the chronic cases was this symptom not mentioned although deep-seated discomfort rather than actual pain is frequently mentioned in many of the chronic cases

Headache is specially noted in 24 acute and 29 chronic cases while a feeling of general malaise and ill being is noted in almost all cases as having occurred in the earlier stages of the illness Vomiting occurred in 16 acute and 31 chronic cases The notes prove this to be almost invariably a late symptom occurring in very acute or advanced conditions Giddiness was noted only in 3 acute and 8 chronic cases and I do not think that it is of any special significance in lateral sinus infection

Temperature on the first day of admission was generally high. It was above normal in 36 and subnormal in 8 acute cases while in the chronic the numbers were 46 and 8 In 68 per cent of the cases the high night and low morning temperature predominated Rigors were noted in 26 acute and 31 chronic cases An early rigor or shivering fit was noted as an early symptom in almost 30 per cent of all cases but the subsequent frequent rigors were invariably a late and ominous symptom

Signs

Tenderness over the mastoid process occurred in 38 of the acute and 36 of the chronic cases the most frequent sites mentioned being the tip and directly over the antrum It was specially noted that in several chronic conditions tenderness was found only on deep pressure

Tenderness down the neck along the course of the jugular vein was specially mentioned in 11 cases two only being of the acute variety all except one chronic case were in advanced conditions

Swelling about the mastoid or oedema was noticed in 27 cases 9 being chronic It is interesting to note that all these were in children and it certainly seems that while the path of infection in the young tends to early involvement of the superficial mastoid cells and therefore a more ready diagnosis in the less frequently affected adult the infection tends to remain in the deeper mastoid cells

On examining the meatus no discharge was discovered in six of the acute cases though in all these the drum is mentioned as red and in four as bulging Similar signs are mentioned in three chronic cases

Redness or oedema of the posterior part of the meatal wall (post meatal spot) near the drum is mentioned in 31 acute and 39 chronic cases This I regard as the most important sign of mastoid disease and is alone a certain indication for operation The presence of this spot is invariably mentioned in all cases during the last six years As an indication of the great value of this sign nine of the above cases were unsuspected and were found during the course of operation for chronic mastoid on patients with prolonged ear discharge and general seediness and in whom the meatal spot was the main indicating sign for operation Where this sign is definitely established I regard operation as imperative even in

*The opening paper of a discussion in the Section of Laryngology and Otology at the Annual Meeting of the British Medical Association at Winnipeg 1929

the absence of any other operative indication, and I firmly believe that if this rule is observed the dangers of lateral sinus disease will be almost entirely eliminated both in acute and in chronic cases

Ophthalmic changes appear to be rare, and except for a very occasional squint (five cases in all, two being chronic) are rather late signs Papilloedema was noticed in 12 cases (7 being chronic) and nystagmus in 15, 9 being acute

Changes in the central nervous system were also very rare Definite signs of cerebral irritation were noted in 8 cases altogether, 5 being of the chronic type, while disturbances of various reflexes were noticed in 14 cases, 9 being chronic Facial paralysis occurred only in two chronic cases Examination of the cerebro spinal fluid is of no early value It will only show whether there is any meningitis or not

Diagnosis

Having enumerated the various symptoms and their relative frequency I am now in a position to give a short clinical picture of an early case of lateral sinus infection

If a patient with acute or chronic suppurative otitis media is found to be abnormally ill, yet with nothing definite to account for the grave general feeling of ill being, suspect sinus infection, look into the meatus and should the red oedematous meatal spot be present—operate! The accompaniment of deep mastoid tenderness, herpes and sordes, a swinging temperature and auditory pain should complete the early diagnosis, and operation should then prevent the occurrence of the more obvious signs

Another necessary early diagnosis may occur during a mastoid operation when it may be difficult to tell whether the interior of the sinus is infected or not I make the following observations on this

In the case of a perisinus abscess and a pulsating sinus surrounded with normal granulations, I have never known this condition not clear up with ordinary drainage The wash-leather sinus is the other difficult type Pulsation may be hard to get, though the sinus is felt to be full Inserting a needle is dangerous, as is also opening, on account of the possibility of infection If on compressing the sinus wall with a blunt probe and suddenly releasing I find the wall return to normal evenly and instantly, I always leave alone and watch for further indications later This sign has proved to be of great value

It will probably be a surprise to some of the specialists present that so little has been stated of pathological aids I wish to make this point very definitely, that the early diagnosis of this condition can only be done on purely clinical grounds, if the surgeon waits till the pathologist has made his diagnosis for him the chances of the patient are greatly minimized

The time to make the diagnosis is in the phlebitic stage, or not later than that of the mural clot The pathological changes in the blood and cerebro spinal fluid should have been prevented by the surgeon, and even if the patient is seen only at a late stage, there should be no need for a good clinical observer to lose valuable time in awaiting laboratory tests

The differential diagnosis at this stage is rendered difficult by the absence of any definite symptoms in an otherwise generally ill condition Unless the great importance of a previously discharging ear is recognized, it is quite easy to slip into such diagnoses as pyrexia of unknown origin and typhoid fever

In all symptomless febrile conditions a thorough search of the usual toxic foci should be undertaken, and it ought then to be wellnigh impossible to overlook the existence of a suppurative otitis media The resulting aural examination would disclose the presence or absence of the red oedematous meatal spot and offensive discharge Having now been placed on the right track, the observer should easily elicit the other abstruse signs of an infective sinus Being absolutely sure of the meatal spot I would definitely insist on a mastoid operation If there is one thing that has impressed itself on my mind it is the mistake of looking for two morbid conditions in the same person Coincidences of this character are extremely rare

The alleviation of a chronic mastoiditis, even if the sinus is not yet infected, must surely be helpful, on the other hand, the finding of a recently infected sinus not only clinches the diagnosis but saves the patient from a much graver situation.

FRACTURES OF THE ARTICULAR SURFACES OF THE KNEE-JOINT*

BY

ROBERT OLLERENSHAW, M.D., F.R.C.S.,

CLINICAL LECTURER IN ORTHOPAEDICS, MANCHESTER UNIVERSITY, HONORARY SURGEON IN-CHARGE ORTHOPAEDIC DEPARTMENT SALFORD ROYAL HOSPITAL, ORTHOPAEDIC SURGEON, MANCHESTER CHILDREN'S HOSPITAL

Of all the injuries which affect the knee-joint those which cause most concern in practice are the fractures of the weight-bearing surfaces of the joint

Statistical evidence is of little value in dealing with such a subject as this, because fractures of the articular surfaces of the knee-joint, exclusive of fractures of the patella, occur by no means commonly At Salford Royal Hospital, Manchester, in the centre of a great industrial area, about 250 fractures of the lower limb are admitted to the wards each year Two periods of three years were selected, and it was found that in the first period (excluding fractured patella and epiphyseal separations) 14 fractures of the articular surfaces of the knee were admitted, and in the second period 17 cases, an average of about 2 per cent of all leg fractures admitted

Fractures of the Femoral Condyles

I intend first to deal with examples of the minority group—namely, the fractures of the femoral side of the joint There are, in the first place, the gross fractures which split the two condyles apart and extend upwards along the shaft with more or less displacement of fragments

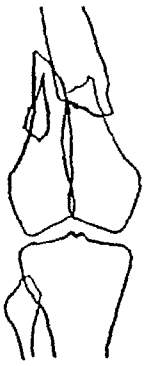

FIG 1

FIG 2.

FIG 3.

This is usually spoken of as a T-shaped fracture into the joint A typical example of this injury is shown by an outline sketch from the radiogram of the right knee of a man, aged 51, who received direct violence from the impact of a motor car (Fig 1) Under general anaesthesia extension was applied and adequate reposition of the fragments obtained A Thomas splint bent at the knee to an angle of 150 degrees was applied Union was firm after eleven weeks, and massage and active movements were commenced A calliper walking splint was worn for a further ten weeks, and the end-result is shown, so far as knee movement is concerned, by further radiograms, which demonstrate the fullest voluntary extension and flexion—namely, 180 degrees to 75 degrees Stability of the joint was good The man returned to work twenty five weeks after his accident An example of a more severe fracture of this type is that shown by the next patient, a man aged 50 His right knee was crushed between two buffers and the joint surfaces of both femur and tibia were shattered (Fig 2) A moderately good reposition of the fragments was obtained and a Thomas splint with extension applied The end-result, as might

* Read in opening a discussion in the Section of Orthopaedics at the Annual Meeting of the British Medical Association Winnipeg 1929

be anticipated from such an extensive articular injury, was poor as regards movement, a range from 180 to 140 degrees only being obtained. Stability was good and weight bearing painless.

Fractures of a Single Condyle

The more usual type of fracture of a single condyle is that shown by a man aged 35 whose knee was forcibly and suddenly abducted by a weight striking the outer side of the joint. The external condyle was found to have been fractured obliquely and forced upwards. Traction on a Thomas splint restored the position and the end result was good, there being a range of movement from 180 degrees to a right angle. Another and less common fracture of a single condyle is that in which the condyle is displaced backwards. In this case, a man aged 26 received a blow on the flexed knee in a motor collision, when I saw him eight weeks later the major portion of the internal condyle was found to have been driven backwards and a smaller fragment was lying loose in front of the joint. The loose portion was removed. The functional result has been excellent—a stable joint with a full range of movement.

Osteochondritis Dissecans

In a description of the articular fractures of the lower end of the femur one must refer to the condition described first by Koenig as osteochondritis "dissecans" sometimes incorrectly referred to in textbooks as 'dessicans". We are familiar with the punched-out area of articular cartilage usually incompletely detached and lying in its bed in the lateral aspect of the internal condyle (Fig 3). Are we to regard this as a fracture? Certain points in favour of this view cannot be neglected. The condition is found fifteen times more frequently in males than in females. Further it is found usually during the most active period of man's working life. There is hardly a case on record where a trauma has not been noted in the history. Lastly, the lesion is found at the point of greatest impact in the joint—namely the area where the inner condyle bears against the tuberosity of the tibia. For these reasons I think we must regard the condition as a localized fracture of the articular surface, and, as the fragment fails to join up with the bed from which it is detached it corresponds to an ununited fracture.

Microscopically it has been shown that although the cartilage cells of these fragments are normal in appearance and seem to be viable the underlying layer of bone is definitely dead. The cavity from which the fragment is punched is lined by a layer of fibrous tissue. Treatment consists in the removal of the fragment and the paring down of the overhanging edges of the remaining crater."

Tibial Fractures

The fractures of the upper end of the tibia are a more varied group and present a number of problems. They may be divided into (1) general fractures of the whole upper surface (2) single tuberosity compression or avulsion fractures (3) avulsion of the tibial spine and neighbouring cartilage, and (4) punched fractures of a small area of a tuberosity. The results of these injuries are often poor for these reasons—first, considerable comminution is present; secondly, there is difficulty of reposition of the fragments; thirdly, the frequent association of ligamentous tears leaving an irregular articular surface and lastly the later development of osteo-arthritic changes. In general one may say that the further away the fracture line lies from the centre of the joint the better is the prognosis for fracture.

The following cases illustrate the varieties of tibial fracture.

A man aged 25 received a severe blow on the outer side of the knee at football. The outer third of the external tuberosity was broken off and displaced outwards and backwards. Under general anaesthesia it was manipulated into position and the knee fixed in a plaster cast for six weeks. Active movement was commenced at the end of this period. He commenced to walk a week later with a calliper splint which was retained for three months. The end result showed a little widening of the condyle with a perfect range of knee movement.

In the next case a collier aged 51 had a crush of the knee from a fall of coal. The upper tibia was shattered and a third was a soiled wound leading almost to the bone. It was impossible to do anything but apply extension to the limb with some lateral compression of the fragments. The result was poor with a union of the separated fragments and absorption of articular cartilage. The knee was stable enough for walking and was not painful but the range of movement was from 180 to 150 degrees only.

The next case is an illustration of the infinitely better result which can be obtained by open operation in this type of fracture.

A man aged 25 received a direct blow on the head of the tibia in a motor cycle accident. Much shattering occurred with

FIG. 4.

FIG. 5.

separation and displacement downwards of a large fragment comprising the internal tuberosity tibial spine and part of the external tuberosity (Fig 4). Open reduction was performed and the fragments fixed by a transverse ivory peg. A good apposition was thus obtained and the limb fixed in a plaster cast for six weeks (Fig 5). At the end of this time active movement was commenced. A calliper was fitted two weeks later and this was worn for four months. It the end of six months he returned to work. The end result eighteen months after the accident showed a very stable knee with a range of movement from 180 to 90 degrees.

Punched fractures of the articular surface of the tibia are not uncommon and are best dealt with as in the case of the femur by excision of the separated fragment.

A man aged 30 fell 15 feet and came down awkwardly on his left foot. The articular surface of the inner condyle of the tibia was fractured and a fragment of cartilage and bone was removed. The specimen showed a piece of bone covered by articular cartilage about 1¼ by 1·2 inch broad. The end result after a year was good and the surface had obviously regenerated. Movement from 180 to 90 degrees was freely considerable. performed.

There remain to be mentioned the fractures of the tibial spine. These are usually brought about by severe wrenches of the joint and are associated with more or less tearing of the crucial ligament.

An example of the less severe type is that of a woman aged 40 who fell down stairs and wrenched the knee producing a forced

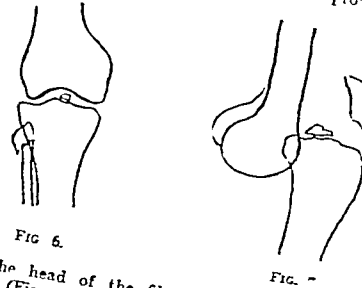

FIG. 6.

FIG. 7.

adduction. The head of the fibula was avulsed and the tibial spine broken (Fig 6). The knee was fixed in plaster for six weeks, and at the end of that time active movement was commenced. No calliper was worn and the end result was a perfectly functioning joint.

The last case I wish to refer to is that of a man aged 36 who fell 20 feet from a scaffolding and suffered a complete dislocation of the right knee. The tibia was dislocated forwards and the tibial spine torn away with complete rupture of crucial ligaments (Fig 7). After reduction a plaster cast was applied and retained for ten weeks. A calliper was worn for a further three months and later a knee cage allowing movement from 120 to 135 degrees for another three months. At the end of a year the knee was fully stable and the joint moved through a range of 180 to 90 degrees.

In summarizing I would say that, in my experience, the tibial tuberosities are broken more commonly by violence directly applied to the flexed knee or by forced abnormal lateral movement than by the so-called "compression"—a term so frequently employed in describing the fractures of this region The tuberosities appear to be fractured with about equal frequency

Treatment

There is such a wide variation in this group of fractures that it is absurd to dogmatize and to insist, as many writers have done, that either non-operative or operative treatment is the method of choice for all types Each must be treated according to its particular needs

All fractures which involve the joint surfaces must be dealt with by early manipulation under full anaesthesia, so as to restore the position as perfectly as possible Open operation must be resorted to if a satisfactory reduction cannot be otherwise obtained Bone pegs should be used where the fragments tend to move so as to jeopardize the adequate reposition Small separated fragments should be excised Fixation in plaster for an average period of six weeks has been, in my own experience, the most satisfactory means of maintaining position

After-Treatment

In the later treatment a strong distinction must be drawn between movement and weight bearing Gently graduated active movement should be commenced as early as possible after union is attained, but, in the severer injuries at least, weight bearing must be delayed for at least three months by the adoption of a calliper walking splint

The end-result, after such treatment, is frequently better than the primary injury would lead one to hope for, but the recovery of movement is usually slow, and I have many times been surprised to find how a knee which has suffered a severe articular fracture and, at the end of six months, showed 30 or 40 degrees of movement would, after another six or twelve months, regain a range of more than a right angle of free and painless movement

This paper was illustrated by numerous radiograms, of which a small selection are reproduced as line drawings

RADIUM IN GYNAECOLOGY.*

BY

SIDNEY FORSDIKE, M D, B S, F R C S

THIRTY years ago radium made an entry into surgical therapeutics, and was greeted with enthusiasm on reports of the cure of malignant tumours Claims were made which were never substantiated, or results were so transient that recurrence of the growth followed hot-foot upon the reports In the course of five or six years disillusionment was complete, and radium treatment was left to the few who still had faith We are now in the second advent, and the enthusiasm displayed suggests that history is repeating itself Responsible men are making themselves answerable for statements that 70 to 80 per cent of early cancers are curable by radium, such claims may possibly be prophecy, they are not history There is a glut of hastily written books on treatment by radium, and a still greater stream of reports of cases treated within the year I recently attended a lecture by the director of a radium clinic who recorded cures of one, two, and three years' standing What does the word "cure" mean? Is it the disappearance of symptoms for a limited time, or is it permanent freedom from disease? Assuredly the latter is the only meaning, and the propriety of using the word in any other sense is open to grave criticism This enthusiasm, sired by our profession and nourished by the press, has placed an enormous sum of money in the hands of a Radium Commission for the purchase of 24 grams of radium element It is proposed to distribute the whole of this for clinical work, not one milligram being allocated to biological research One would suppose that there was nothing unlearned of the effects of radium upon living tissues, and that, given the supply, the disappearance of the cancer was only a matter of application A certain amount of work has been done upon normal tissues, tissue cultures, and animal tumours The knowledge gleaned from these sources is of great value, but it must be multiplied ten, twenty, and a hundredfold before we are in a position to direct the gamma ray with precision and certainty At present the only research radium in the country amounts to something less than a gram, privately owned and divided into small quantities, if all the problems to be investigated are to depend on this supply alone, then another generation must pass away before they are solved These problems are urgent and imperative, and must be attacked while the wave of enthusiasm is high. The Radium Commission would serve the community to the best advantage in the organization of research work and in the allocation of whatever radium was necessary for the purpose

How Radium Acts

It is a matter of dispute between workers whether radium acts directly upon the cell or upon the stroma. The microscope shows us the change of structure which has taken place in the tissue after irradiation, but it tells us nothing of how or why the change has taken place The ingenious application of cinematography, by Canti, to irradiated tissue cultures has extended the knowledge acquired by the study of the dead cell, but while we have a dramatic view of the cell being struck down it does not solve the question why it is smitten This effect may be due to direct action on the cell by the gamma wave, but it is equally probable that it is caused by a primary change in the stroma After a long investigation[1] of the effects of radium upon normal and malignant tissues I was forced to the conclusion that the primary action was upon the stroma, and the cell change secondary to it This problem, however, is not to be settled by the study of structure alone, it must be combined with observation of the change of function in secreting and excreting glands after irradiation Furthermore, the help of the biochemist must be enlisted to investigate changes in the chemistry of the cell after exposure to radium The importance of this question cannot be exaggerated, for upon its solution depends the decision of the dose to be employed

Screens

One would think that the value of metal screens must have been settled long ago, and yet the following values are given in three different books for the absorption of 99 9 per cent beta rays

	Brass	Silver	Lead	Platinum.
Cade	1 60 mm	1.30 mm	1.20 mm	0 60 mm
Larkin	2 0 mm	1 0 mm	1 0 mm	0.50 mm.
Simpson	1 10 mm	0 80 mm	0 80 mm	0 40 mm.

Russ[2] has shown that with 0 5 mm platinum about 20 per cent of the ionization is due to the moderately penetrating rays, and they are responsible for the necrosis which occurs around the source of energy This necrosis is either beneficial or inimical to the treatment, and therefore it is of paramount importance to ascertain the true value of the screen Needles containing one, two, three, or more milligrams of radium element are being used for cancer of the tongue, breast, and cervix with a thickness of 0 5 mm platinum, and the immediate results are reported to be satisfactory On the other hand, the Radium Institutes of Stockholm[3] and Paris use a minimum equivalent of 1 mm platinum, from which permanent results are reported It is not probable that both methods are equally favourable, and it is imperative to determine which is the more favourable Some experiments by Lazarus-Barlow,[4] in which he used screens of varying thickness—0 5 mm, 1 mm, 1 5 mm, and 2 mm platinum—throw light on this problem He found that the minimum injury to normal tissues and the maximum to actively proliferating cells was produced when the heavy screens were used These results are crucial, but they need to be

* Read in opening a discussion in the Section of Obstetrics at the Annual Meeting of the British Medical Association Winnipeg 1930.

repeated and extended. A further point which needs investigation is the radiation value of the metals used for screens. Physicists tell us that 1 mm. platinum is equivalent to 2 mm. lead in screening power. Is it certain that the gamma rays which has passed through lead has a similar value to the gamma ray which has passed through platinum? Discrepancies in clinical and experimental work when using different screens of equivalent value suggest that this may be one source of error.

Split Doses

A problem equally pressing is whether the dose should be applied continuously or divided into two or more exposures. How far do living tissues conform to physical laws? *Ceteris paribus* the ionization effects of 100 mg. of radium element for one hour are equal to 50 mg. for two hours. Does the law hold when living tissues are in question? In practice Radiumhemmet gives three large doses at intervals of ten and twenty-one days, whereas the Curie Institute gives a prolonged exposure of four, five or six days of a smaller quantity. Can it be that both methods are equally favourable or are we treading the radium path blindly? Some experiments recorded by Lazarus-Barlow suggest that this is a complicated problem. Using the same dose of radium he employed a large quantity for a short time and a small quantity for a relatively long time, and found that the results upon columnar and squamous epithelium were practically reversed. He concluded that the same arrangement of time and quantity in a dose of radium produces very different effects when acting upon the three types of epithelial tissues—columnar epithelium, dry squamous, and moist squamous epithelium. Maximum effects are produced upon the epithelial cells, and minimum effects upon the associated tissues in the case of a columnar-cell growth when the quantity of radium is relatively large and the time relatively small, whereas in a squamous-cell growth the optimum effects are produced when the quantity of radium is small and the length of exposure relatively long. It is obvious that these experiments go to the root of the problem but they need amplifying and research work with this object must be organized.

Treatment of the Regional Glands

Finally, the clinical problem arises as to the treatment of the regional glands. The weakness of the Radium-hemmet technique is that it relies upon uterine and vaginal radium entirely, which means that the involved glands are being treated palliatively.

Various methods of applying radium in the pelvis have been tried from Dael's chain implanting radium and packing the pelvis with gauze for a week, fixing radium in drainage tubes, which are brought to the surface through stab wounds to burying radium needles for a week at the end of which time a second laparotomy is performed to recover them. These methods are uncertain, inexact and make a big call upon the woman's fortitude and courage. Some of these methods have been described as a "barrage of radium," an unfortunate term for it is as likely to form a mental barrage to progress as a radiological one to exclude the cancer cell.

Recasens (Madrid)[6] has combined *x* rays with radium for many years, and claims improved results over radium treatment alone. However, as far as I know he has not published statistics in support of this claim. The Curie Institute has been using *x* rays as well as radium since 1923–24, a comparison of its results before and since should prove instructive. A third method is coming into use in which the treatment of the cervix by radium is followed by excision of the regional glands. It is obvious that with such varied practice there is urgent need of organized research in this direction.

RADIUM IN BENIGN CONDITIONS

Whatever the view may be with regard to the treatment of carcinoma there is no doubt about the efficacy of radium in producing an artificial menopause. Even here however there is a difference of opinion upon two important points: (1) dose of radium, (2) whether the endometrium or the ovaries are affected.

Dose of Radium

Here we find the differences somewhat startling:

50 mg. radium element in 0.5 mm. platinum *in utero* for seventy-two hours.
100 mg. radium element in 1 mm. platinum *in utero* for forty-eight hours.
150 mg. radium element in 1 mm. platinum *in utero* for twenty-four hours.

The object we have in view in menopausal haemorrhages is to convert the endometrium into connective tissue without the production of necrosis. We find that this occurs experimentally and clinically when the hard gamma ray is used alone. A long exposure to beta rays produces necrosis of the tissues in the immediate vicinity of the radium. In the case where 50 mg. of radium element protected by 0.5 mm. platinum is placed *in utero* for seventy-two hours, 20 per cent. of the ionization effects are due to hard beta and soft gamma rays: necrosis ensues, and if it remains aseptic partial or complete obliteration of the uterine cavity occurs. Complete obliteration may or may not be desirable but with partial occlusion there is a grave risk of prometra. If the necrosed surfaces become infected sloughs of the endometrium and secondary haemorrhage follow, and when healing does take place it is again by way of partial or complete closure of the uterine cavity.

The larger doses of 100 mg. of radium element in 1 mm. platinum for twenty-four and forty-eight hours rarely result in necrosis but it is quite common to hear of severe irritation of the bladder and rectum. This irritation is often transient but it sometimes lasts for months despite all treatment, and the patient has exchanged painless haemorrhage for continuous pain and discomfort. Aschersen[7] reports the local changes which occur as a result of these heavy doses: hour-glass contraction of the vagina, atrophy of the portio, shortening and stenosis of the vagina, and ovarian neuralgia.

In 1926[8] I published the results of 200 cases of severe uterine haemorrhage treated by 53 mg. of radium element in a screen equivalent of 1 mm. platinum placed *in utero* for twenty-four hours, and expressed the opinion that this dose was probably unnecessarily large. Since then I have (in some cases) reduced the time to twenty-two hours and the results are no less satisfactory with these doses there has not been a single complaint of irritation of bowel or bladder.

Does Radium Act upon Endometrium or Ovaries?

The German view, arguing from the analogy of the Roentgen ray that "castration" by radium acts by arrested ovulation, is still widely held despite clinical, physical, and experimental evidence. The law of inverse squares was ignored: the three and a half inches separating normally placed ovaries from radium placed in the uterine cavity was forgotten, the knowledge that the demonstrable action of radium upon tissues under similar conditions is limited to three-quarters of an inch was unknown when this argument was advanced. To settle this problem I undertook a critical investigation on the ovaries of cats in which the conditions were precisely similar to those in clinical work. The results were conclusive in showing that the ovaries remained unaffected and that the changes in the endometrium were alone responsible for the cessation of haemorrhage. An account of these experiments and analysis of the clinical evidence was reported to the Gynæcological Section of the Royal Society of Medicine.[9]

FIBROIDS

Radium is used in the treatment of these tumours but in my opinion when treatment is required at all it should be by excision because while radium banishes haemorrhage and causes the tumour to shrink it will not make the growth disappear. Fibroids are peculiarly liable to degenerative changes and therefore it is advisable to remove them. The only exception is where haemorrhage is the cardinal symptom and a small fibroid is discovered during an examination under anæsthesia: in such cases treatment by radium is justifiable.

RADIUM TREATMENT OF CANCER OF THE CERVIX

It is slowly being recognized that the early results are not permanent in the majority of cases, and therefore not worth recording except as evidence of the value of radium for palliative treatment. Reports on a five-year basis will alone enable us to assess the true value of radium in the treatment of malignant disease, and for this purpose they are equally important, whether favourable or not.

The classification of cancer of the cervix under the international standard is not easy, for the definition which creates Classes 2 and 3 covers inflammatory as well as malignant conditions, and it is sometimes impossible to differentiate between them. My series of cases in the five-year period 1921 to 1925 consists of 211, divided as follows:

1. Cases in which the disease was limited to the cervix (operable) — 14
2. Cases in which the vagina and parametrium was involved and the uterus tethered (borderline) — 53
3. Cases of advanced disease (inoperable) — 144

Operable Cases

The following table shows the results in the 14 operable cases:

Recurrence of Growth				Remained Free = 28%
1 year	2 years	3 years	4 years	5 years and over
3	4	2	1	4

Remained Free.—One patient was alive and well nine years after treatment. One died of chronic bronchitis and cardiac failure seven and a half years later. She had been treated with radium and x rays. One was alive and well six years later. The fourth was alive and well five years afterwards.

Recurrence of Growth.—In three patients recurrence took place in the cervix, and in five a pelvic mass developed while the cervix remained healed.

Borderline Cases

In 20 of these cases the condition improved so much after the first exposure to radium that I performed the radical operation upon them. The results of the remaining 33 are as follows:

Recurrence or Death within 5 years					Remained Free = 12%
1st year	2nd year	3rd year	4th year	5 years	5 years and over
13	8	6	1	1	4

Remained Free.—In one a laparotomy had been performed at another hospital for a Wertheim's operation, but it was abandoned. She has remained under observation for eight and a half years, and is free from disease. The second was under observation for six years, during which time she remained well. The third is alive and well at the end of six years. This patient was treated with radium and x rays. The fourth is alive and free from disease after five and a half years.

Recurrence or Death within Five Years

Case 180.—This was a carcinoma of the stump of the cervix occurring some time after a subtotal hysterectomy. Three years after treatment her right breast was removed for a malignant growth. Two years later, and five years after the radium treatment, she returned with a mass in the pelvis, but whether it was a metastasis from the breast or a recurrence from the cervix was not decided.

Case 172.—In this case the patient died from cerebral haemorrhage four years after treatment, but there was no recurrence of disease in the pelvis.

Of the 13 patients who were lost or died within the first year, one died of uraemia after one exposure, and one patient had one exposure and then underwent an operation at another hospital.

Recurrence took place in the pelvis in 10 of these cases. It is worth remarking that of the 14 operable and the 33 borderline cases, recurrence deep in the pelvis occurred fifteen times, which corresponds approximately to the number of cases in which the glands are found to be involved.

Inoperable Cases

Recurrences after Wertheim's Operation.—These cases numbered 40. The difficulties attending their efficient treatment by radium are insuperable owing to the proximity of the bladder and rectum, and I have derived no encouragement from my results. Temporary relief was the best sequel, and not one patient survived beyond one year. Vesical fistulae occurred in three cases, but it is not possible to say whether this was due to the growth or to the radium, it is certain, however, that a fistula would have resulted if left untreated, but it is probable that the treatment hastened the condition.

Advanced Cases.—There were 104 of these, 10 of which were not suitable for treatment on account of fistulae, metastases, or cachexia. Of the 94 treated 73 died in one year, 16 in two years, 2 in three years, 2 in four years, and 1 in five years.

At this stage of the disease there is no hope of curing the patient, but the symptoms, haemorrhage, offensive discharge, and pain are relieved in 80 per cent., and life is prolonged in comfort for 20 per cent. In the cases which survived for three, four, and five years a slowly enlarging pelvic mass was present throughout, and pressure symptoms ultimately appeared.

In this class recto-vaginal fistulae occurred in two cases and vesico-vaginal fistulae in three. In advanced malignant disease of the cervix fistulae are of common occurrence before the termination of life, and it is not possible to attribute them to the radium alone. I had to ligature the internal iliacs for secondary haemorrhage on eight occasions, in three of these cases a virulent infection was present, and it is probable that the arterial wall had undergone such changes that secondary haemorrhage was imminent, for in two of them it appeared within three days of the first exposure. In the third patient there was an interval of fifteen days between the first and second exposures, and the haemorrhage ensued immediately after the second. In the other five cases healing of the ulcer had made great progress, but had reached a callous stage in which a small unhealthy cavity was surrounded by a massive deposit of fibrous tissues.

Summary of Results

The total number of patients treated by radium was 181. In the inoperable cases the results were palliation and prolongation of life, 134—none cured, borderline cases, 33—4 cured, operable cases, 14—4 cured.

The rate of cure in all the cases treated by radium was 4·5 per cent., or 1 patient out of 22, in the borderline cases 12 per cent., or 1 patient out of 8, and in the operable cases the rate was 28 per cent., or 2 patients out of 7.

If the advanced cases, where no cures could be expected, are omitted there were 47 operable and borderline cases, of which 8 were cured (17 per cent.), or 1 patient out of 6.

Remarks

These issues were not comparable to those of Radium hemmet or to those obtained by operative surgery, and I attributed the comparative failure to an immature technique which was tentative and unsettled. Therefore in the current five-year period I adopted the technique of Radiumhemmet in one series of cases, and that of the Curie Institute in another. The latter I abandoned after treating twenty cases, owing to the production of callous ulcers which never completely healed. I persevered with the Stockholm technique, and, although the five-year period is not yet up, the conclusions do not show any improvement. I visited the Institutes of Stockholm and Paris to ensure that my methods did not differ in any material way and was satisfied that the technique offered no reason for the marked difference in results.

I remain a believer in the future of radium, but feel that to-day we are a long way from accepting it as a sovereign cure for all malignant tumours in the meantime I am convinced that surgical treatment offers the patient a better chance of cure. Unless our knowledge of radium

is greatly increased, and the immediate results of treatment are placed in proper perspective, I foresee a general resumption of treatment by operative surgery

MEDICAL, SURGICAL, OBSTETRICAL

NODULAR SPLENIC TUBERCULOSIS WITH GROSS ENLARGEMENT

THE fortuitous discovery of a case of tuberculous nodules of the spleen, with gross enlargement of the organ, seems to be worthy of record, in view of the rarity of such an occurrence in an otherwise healthy subject

A youth aged 22 met with sudden death in a motor collision in May He had had no previous illness and the family history was good

At the post mortem examination fracture of the skull was found but there was no disease of the organs other than the spleen which was full of nodules these on microscopical examination were reported to be tuberculous in origin They were whitish yellow ranging in size from that of a pinhead to at least 1 ½ inch in diameter They projected slightly beneath the capsule and also from the cut surface On section conglomerate tubercles were revealed with scattered giant cells and numerous epithelial cells. The larger nodules showed commencing caseation

Section of Spleen.

The case is interesting because it is rare for tuberculous infection of the spleen to occur apart from similar manifestations elsewhere Moreover it is unusual for such great enlargement to be caused by numerous nodules the organ measured 6½ by 4½ by 3 inches and weighed 9 ounces This occurrence must be extremely rare in a youth otherwise perfectly healthy at the time of death

I am indebted to Dr J A D Radcliffe (pathologist to the Royal Portsmouth Hospital) for the pathological report

REMOVAL OF SAFETY-PIN FROM DUODENUM

CERTAIN interesting features of the case here described justify, in my opinion its publication

On May 26th a male infant aged 6 months was brought to me by the mother who stated the child had just swallowed a small safety pin The child appeared quite at ease but an x ray examination revealed the pin lying open to the right of the second and third lumbar vertebrae probably in the pyloric end of the stomach. Examination of the abdomen showed no sign of peritoneal irritation but the child was admitted to the Great Western Hospital for observation and x ray photographs were taken on four consecutive days Since the pin however remained in the same anatomical position and continued to lie vertically suggesting that it had become fixed in the stomach wall I decided to remove it

On May 29th a general anaesthetic was administered and the abdomen was opened by an upper right paramedian incision. To my surprise I was unable to feel the pin in the stomach but eventually it was located in the duodenum at the junction of the second and third portions It is rather surprising that an open safety pin can proceed as far as the third part of the duodenum before it becomes anchored I reframed from opening the duodenum since it is difficult to manipulate this part of the organ especially in an infant and also one hesitates to open it because of its liability to leakage I therefore incised the stomach about one inch proximal to the pylorus and attempted to coax the pin up from the duodenum into the stomach It appears that the pylorus of an infant will just admit the little finger but it was impossible to pull the pin up—even with the aid of forceps—owing to its being fixed to the duodenal wall. The stomach was therefore closed

It appears that the pin was caught in the wall of the duodenum I succeeded in completing the perforation and in forcing out the pin as far as the head. It would have been almost impossible to incise the third part of the duodenum and to suture it successfully without fear of leakage A purse-string suture was passed around the pin and by means of a sharp pull the head was torn through the bowel wall the purse-string suture was immediately tightened and tied and the abdomen was then closed

The child made an uninterrupted recovery and was discharged from hospital thirteen days later

Should I ever be called upon to perform this operation again I should make the incision at least 1½ to 2 inches proximal to the pylorus because in suturing the wound of the stomach the pyloric sphincter was encroached upon tending to occlude the lumen Nevertheless it has been my experience that in cases of perforated pyloric ulcer treated simply by purse-string suture and invagination, however much is taken up in the suture and invaginated, pyloric obstruction does not occur and gastro-enterostomy is quite an unnecessary procedure

Assistant Surgeon Great Western Railway Hospital, Swindon.

PASSAGE OF GALL STONES THROUGH THE ABDOMINAL WALL

THE case described by Mr F H McCay in the *Journal* of July 26th (p 142) of the natural passage of gall-stones through an external sinus prompts me to record a somewhat similar though perhaps even more uncommon, occurrence in a patient seen recently at the Manchester Royal Infirmary

A woman aged 60 gave a six months history of gradually increasing jaundice and loss of weight with clay-coloured stools dark urine anorexia and occasional vomiting preceded by repeated attacks of typical gall-stone colic, and extending over a period of twenty four years. She stated that during this time she had passed through her abdominal wall at intervals thirty four stones of varying dimensions but usually of the size of small pebbles They appeared singly or in groups of two or three Their passage was preceded by the formation of a small swelling under the skin which when fomented discharged the stones externally leaving the sinus exuding a thick yellow fluid Abdominal examination revealed the scars of three excised ones in the epigastrium and two in the right hypochondrium. A large mass present in the latter region was subsequently diagnosed at operation as an inoperable carcinoma of the gall bladder this finding being later verified histologically

I am indebted to Mr P R. Wrigley for permission to record this case

Reviews.

AN INTRODUCTION TO THERAPEUTICS

IT is a matter of common knowledge that students in our teaching hospitals are well and systematically taught the modern methods of diagnosis by lectures as well as in the wards, but, when they graduate, their idea of how to treat a sick patient is very rudimentary Dr Campbell's new *Handbook of Therapeutics*[1] is meant to rectify, as far as possible, this gap in knowledge, and certainly there has been no good short textbook on treatment available to our students for a number of years Materia medica and pharmacology were formerly taught by practising physicians, and Dr Campbell was fortunate in having the physician and pharmacologist, Professor Ralph Stockman, as his teacher Of him Campbell states that "he has had no direct responsibility for any of the contents of this book, but its pages inevitably reflect his teaching"

Nowadays, especially in the medical schools of Great Britain, pharmacology has to a large extent simply become a special branch of physiology, devoted to animal experiment, while pharmacy and materia medica are seldom taken seriously as a study A further handicap to the student is the necessity of using standardized mixtures and prescriptions in order to save the dispenser's time, thus little opportunity is given for learning the art of correct prescribing Professor A J Clark's treatise, *Applied Pharmacology*, was a fine attempt to bring the results of pharmacological experiment into direct relation with therapy, but his book does not bear directly on the individual patient Dr Campbell is a physician and, obviously, is constantly making use of and testing the effects of the therapeutic measures which he recommends His book may be used as a short reference in the treatment of individual cases, but larger and more detailed books or monographs would sooner or later be required Its main value is that it gives a systematic survey of the therapeutic methods which the student, with his naturally limited survey of cases in his three clinical years, only picks up spasmodically and in scraps It is an excellent book for every medical student to read in his final year, while no better present could be made to a young graduate about to take up the post of house-physician, or to begin as an assistant in general practice It is essentially a student's book, and not an advanced book It fills a real want, and at the moderate price of 12s 6d should command a ready sale in all medical schools It would be an excellent thing if this book became well known, not only in this country but in the United States, where such a view of medical therapeutics is much required

MYCOSES OF THE SPLEEN

THE suggestion put forward by Dr A G GIBSON sixteen years ago, that certain forms of splenomegaly are caused by a streptothrix, has not been generally accepted Subsequent study of the subject has confirmed Dr Gibson in his original opinion, and in a recently published work, *The Mycoses of the Spleen*,[2] he has given an impartial review of the question, and has made out a strong case in support of his thesis

The splenomegalies under discussion are those occurring in cases of splenic anaemia, acholuric jaundice, and Banti's disease As is well known, these spleens often contain small dark nodules of the size of a lentil or less, presenting a pale centre with a haemorrhagic peripheral zone They are known as Gandy-Gamna nodules From Dr Gibson's descriptions and figures there can be no doubt that the nodules sometimes contain a streptothrix, and he has demonstrated its presence in nine out of thirteen cases of splenic anaemia, in ten out of thirteen cases of Banti's disease, and in five out of six cases of acholuric jaundice Excluding three doubtful cases of syphilitic splenomegaly, the author has not been able to find nodules in other splenomegalies Other investigators, however, are said to have found them in cases of atrophic cirrhosis, haemolytic icterus, calculous cirrhosis, lymphatic leukaemia, and Still's disease, but then much more frequent occurrence in the three splenomegalies under discussion appears to admit of no doubt Dr Gibson has succeeded in isolating the streptothrix in pure culture, and finds that it belongs to the genus Nocardia, an organism composed of mycelial hyphae with a radial habit of growth, showing true branching, and tending to develop into colonies made up of these hyphae, some of which may have conidia attached, all strains conform to the old genus Actinomyces Experimental injection of the organism has shown it to be non pathogenic for guinea-pigs, rats, and mice, but pathogenic for monkeys In the latter case it produces a slow illness, the average length being 342 days, ending in death The symptoms are a gradual deterioration in bodily activity without loss of appetite, tenderness in the splenic region with or without enlargement of the spleen, slight anaemia, and no recognizable fragility of the red blood corpuscles Neither in the spleen nor in other organs has it been possible to demonstrate the presence of streptothrix threads, but in six out of seventeen cases the identical organism was recovered either from a blood culture during life or from the blood or spleen after death

Dr Gibson observes that the etiology of these splenomegalies can only be proved by the repetition of his observations by other workers, no positive opinion can be formed until the findings become general and uniform Extensive investigations on this subject have recently been undertaken by Professor Nanta, who has demonstrated the presence of what appears to be an Aspergillus in the nodules, it is possible, therefore, that certain cases of splenomegaly are due to invasion by this organism

THE PLATING OF BONE

ELEVEN dogs were experimented upon by Dr ROBERT FRANTZ to test the effects of metallic osteosynthesis by means of plates, etc, on unbroken and on broken bones[3] This research was carried out in the laboratory of experimental surgery founded by Professor Bernard Cunéo in the Ecole Pratique of the Faculty of Medicine of Paris. Professor Cunéo writes an appreciative preface The operations performed and the changes found after killing the animals many days after operation are described in full detail, but no very revolutionary conclusions are set forth Dr Frantz points out that undue pressure on the bone is to be avoided, and that this may be effected by two methods (*a*) reduction of force of constriction, and (*b*) increase of the surface of the restraining medium Of the appliances tried, the staples and wires of Cunéo affect the least and the sleeve of Contremoulins the greatest surface The fitting of appliances should not require unusual technical skill In case of intolerance, reaction is most marked when the volume of the foreign body is considerable, therefore the less the bulk of the plate or staple or other object the better

After describing and discussing these experimental operations on dogs, Dr Frantz goes on to consider their application to human surgery His conclusions appear to be sound He points out the paradox, that the functional results of open operation and "plating" may be poor although the anatomical position and the union may be ideal At the same time, one sees cases of fracture treated by non-operative methods in which the anatomical "end to-end" results are poor, but the functionals are excellent He concludes, wisely, that if one can obtain consolidation of a fracture, with restoration of the axis of the limb without cutting operation, this method should be preferred, and metallic osteosynthesis be strictly reserved for fractures of which the cure is impossible by other means

PHYSICAL ANTHROPOLOGY

ANTHROPOLOGY, as we understand it to-day, is a composite science and it requires a combination of experts in various biological subjects to cover its entire field. Physical anthropology is one branch of this science and broadly speaking deals with the anatomy of the Hominidæ. It is fit and proper therefore that this subject should be in the hands of the specialist in human and primate anatomy. But if is equally fit and proper that the general anthropologist with no training in anatomical science should cultivate at least a superficial acquaintance with the main points of physical anthropology so that he may rightly appreciate the significance of anatomical factors in their relation to human evolution even though he may not himself be competent to interpret them. Mr. E. P. Stibbe's book, *An Introduction to Physical Anthropology*,[1] serves to meet the need of those would be anthropologists who have no first-hand knowledge of human anatomy. It is based primarily on the syllabus for the B.A. and B.Sc. degrees in anthropology of the London University.

The main feature of the book we think is that it reduces the whole of physical anthropology to its simplest expression and thus provides for the novice a clear and concise survey of the subject. As is customary in works of this kind a very large proportion (almost half) of it is taken up with osteology, presumably because of its importance in connexion with the study of fossil remains. Unhappily however, this has the disadvantage of dissociating in the mind of the amateur the skeleton from the "soft parts" and of suggesting that it is possible to assess the significance of skeletal characters without an intimate knowledge of anatomy as a whole. Nothing could be more misleading and, indeed, the results of such an attitude of mind have more than once been illustrated by the unfortunate reconstructions of fossil man which have been put forward by scientists who have never so much as dissected a human body. For this reason we are sorry that Mr. Stibbe has not dealt with the anatomy of the "soft parts" except for a brief reference to the evolution of the brain and to surface anatomy. Perhaps however such a criticism is not of so much importance in connexion with a textbook which does not purport to be more than an introduction.

The first part of the book deals mainly with the skeletal structure of man and the man-like apes and this part has been arranged in a somewhat unusual manner. The left-hand pages read in continuity, give a description of the human skeleton and the corresponding parts of the apes are placed opposite on the right-hand pages. We confess we are not enamoured of this arrangement. To our mind it is more difficult to read in continuity thus and it might even be construed as a reflection upon the mental powers of the reader that such a tabulation should be necessary in an elementary book of this kind. Part II. deals with the anatomy of fossil man, and the value of the short descriptions is considerably enhanced by a series of excellent illustrations. Part III. deals with racial anatomy, and contains a clear account of the methods adopted for the examination of the living subject and of the skull.

A work of this type has been badly needed for a long time, and if it errs on the side of brevity, Mr. Stibbe's book certainly provides a most convenient summary of present knowledge and methods of physical anthropology.

THE COTTAGE HOSPITAL

WHATEVER fate the future may hold for the hospital system in this country under the new Local Government Act, it is possible that the authors of a recently published book on cottage hospitals[2] are right in their surmise that these institutions will remain as at present voluntary hospitals. They think, in fact, that their numbers will increase until every rural district possesses its cottage hospital. Inspired by this ideal Major Du Plat-Taylor, Mr. John Coleridge, and Mr. Johnston Abraham have combined their efforts as engineer, architect and surgeon, in order to instruct committees of the charitable in the construction and administration of suitable buildings. It is perhaps a pity that the authors did not subdivide their subject so as to show not only what should be done in areas where wealthy subscribers are numerous but also what could be done in sparsely inhabited poor districts. Their account of what a cottage hospital should be is admirable but if a network of these institutions is to be established throughout the country on a voluntary basis charitable committees might well be frightened at the cost of some of the equipment described as essential. In the authors' view cottage hospitals are primarily surgical hospitals, and "the theatre of a cottage hospital should be as well planned and equipped as any of those found in a large London teaching hospital." They base this view on the ground that it is often impossible to move surgical cases to a general or special hospital so that all equipment for major operations and a high standard of surgery are alike necessary. They seem to think that if the latter requisite is missing locally it should be obtainable from the surgeons of any neighbouring town one of whom may chance to have a country house in the neighbourhood. It is possible, however, to suggest that the argument derived from the ease with which the motor car can transfer the surgeon to the cottage hospital may be used in the opposite direction. In most cases, probably, but little extra time would be lost in transferring the patient by ambulance to the general hospital where efficiency due to frequent practice would outweigh the value of high-class cottage hospital equipment which might be rarely used. While, therefore, we may admire the authors' enthusiasm in setting before cottage hospital committees a high standard for their institutions it may be that in many cases the standard is higher than the circumstances would warrant. It is true that among the plans appended to the book there is a simple one designed apparently for a maximum of twelve beds but the letterpress seems to us to call too little attention to institutions of this size which are probably more appropriate in most areas in this country. In the scheme for hospital services put forward in the Dawson Report some ten years ago cottage hospitals formed an integral part. Their function must surely be to serve the medical and obstetric needs of the district no less than the surgical. The only excuse for over-emphasis of the surgical aspect must be sought probably in the enormous increase of road accidents. The authors have found space in their small book to express their views on the financial solution of this problem; they have also managed to include the greater part of a speech made at a hospital dinner as a model for chairmen in the art of extracting money from the charitable. Apart from these fringes of thought of doubtful or debatable value the book is an excellent exposition of the way in which a cottage hospital with wealthy subscribers should be constructed, equipped, administered and maintained.

NOTES ON BOOKS

THE scrupulous thoroughness of the American textbook seems likely not only to detract from the interest of the subject but also to quell the spirit of adventure in the reader. There is an atmosphere of awe inspiring efficiency about Miss Gladys Sellew's book, *Ward Administration*.[3] The duties of the head nurse and the placement of the floor duty nurses are minutely defined. Time studies are made of the total number of minutes required in the daily routine for every variety of duty from passing bedpans to giving Sherman's vaccine hypodermically, and from these time studies the number of nurses required to staff a ward is calculated. Everything is defined—the responsibility of the supervisor, the essential qualities of supervision and the nature of work. Algebraic formulæ are given for ascertaining the cost per hour of a nursing service. Standardization, co-operation and other blessed words appear—the statement that every nursing student should learn how to assist the doctor when he is taking blood for a Wassermann, the efficiency expected in the nurse is shown by—intervals and the exactness of the technique required in drawing from the longitudinal nose) an infant. But Miss Sellew's book

[1] *An Introduction to Physical Anthropology*. By E. P. Stibbe, F.R.C.S. London: E. Arnold and Co. 19.0. (Demy 8vo, pp. viii—140, 42 figures, 1 map. 12s. 6d. net.)

[2] *Cottage Hospitals*. By Major S. Du Plat Taylor, M.Inst.C.E., M.I. Mech.E., John Coleridge, F.R.I.B.A., and J. Johnston Abraham, C.B.E., D.S.O., M.D., F.R.C.S. London: E. Benn, Ltd. 19.0. (Cr. 8vo, pp. 103, 22 figures. 12s. 6d. net.)

[3] *A Text Book of Ward Administration*. By Gladys Sellew, B.S., R.N. Philadelphia and London: W. B. Saunders Company. 1930. (5¼ × 8, pp. 259, illustrated. 12s. 6d. net.)

is worthy of perusal partly for the light it throws on the American attitude towards organization, partly because, even if the vision of such efficiency seems blinding to our eyes, a judicious blending of methods and points of view may not be without value

By the time a book has reached its twenty fourth edition all a reviewer usually has to do is to record this fact, but in the case of the manual by Dr OTTO SEIFERT and Dr FRIEDRICH MUELLER on *Physical and Clinical Diagnosis*[7] these previous editions have been in German, and for the first time it is available in English, thanks to the work of Dr E COWLES ANDRUS This authorized translation has been adapted, mostly by means of clearly marked additions, for the American student and physician, and the slim volume of over 500 pages contains a mass of information on all varieties of physical diagnosis Illustrations are throughout good and the colour plates excellent, particularly of the blood The letterpress is most difficult to criticize from the English standpoint A third year student confronted with this book in this country would get stuck very early in his attempts to read it through, and the fluency of a comparable book, such as "Hutchison and Hunter" (late Ramy), is strikingly absent There is no hint anywhere that the patient has a mind as well as a body, and the few pages dealing with children are quite inadequate Dr G E Fahr commends this work to medical students and practitioners in an introductory note

In *The Nature of Life*[8] Dr EUGENIO RIGNANO, professor of philosophy in the University of Milan, exposes the weak points in the mechanistic conception of life, for which physiologists are largely responsible, and in the animistic vitalism explanation, supported by psychologists, and proposes a solution intermediate between them—the vitalistico energetic conception In the first part, which occupies about two thirds of the book, the purposiveness of vital phenomena is established, and part two contains the arguments for the above mentioned hypothesis as to the nature of life, which the author has previously put forward in books on the inheritance of acquired characters and on biological memory The universe as a whole is not, he believes, teleological, but that part of the universe constituted by life is alone animated by a particular form of energy which imbues with purposiveness every one of its manifestations

PREPARATIONS AND APPLIANCES

OSTEOCLAST WITH SCREW CONTROL

MR ALEXANDER MACLENNAN (Glasgow) writes The accompanying figure illustrates an osteoclast made for me by Messrs Thackray, Leeds The pattern is founded on the ordinary steel rail bender I have had the instrument in use for a considerable time, and am satisfied with its performance In attempting to straighten deformed bones, to move stiff joints, or to correct such a condition as talipes, manual efforts are futile and exhausting, as so much energy is dissipated in controlling the corrective force With the screw adjustment (H) the amount of force available is very great, and yet is absolutely under control—a feature entirely absent from the lever osteoclast in general use To minimize injury to the tissues the resisting arms (A and B) and the plunger (C) are encased in thick rubber tubing (sponge rubber, wool, etc, may be used to supplement the rubber when required) I have found that with the employment of even considerable force less damage to the soft parts results if the pressure in only applied for a short time As the control is so perfect the necessary pressure may be rapidly applied, and once its action has been achieved the tension may be removed by unwinding the screw A detailed description of the apparatus is obviated by the diagram The arms (A and B) are adjustable on the bar (G) by the screws (D and E) so that curves of various diameter may be treated The bar (F) slides in its sockets, so that extra leverage may be applied to the screwed plunger (H)

The Sections.

SUMMARY OF PROCEEDINGS

(Continued from page 434)

SECTION OF MEDICINE.

Thursday, August 28th

FUNCTIONAL DISORDERS OF THE COLON

THE meeting was opened by the President, Lord DAWSON OF PENN, who called upon Dr EDMUND SPRIGGS (Ruthin Castle) to introduce the discussion on functional disorders of the colon Dr Spriggs said that the colon had been abandoned by Metchnikoff as a useless relic, stormed by half a generation of enterprising surgeons who removed large pieces, or, when most merciful, stitched it in its presumed place, laved with many waters by physicians, and dosed by the public, it had been and still was a battlefield, with long-drawn-out onslaughts and retreats, the Flanders of Medicine It was indeed fortunate that the large bowel, though easily injured by wrong habits and treatment, had great powers of recovery In 4,000 cases under Dr Spriggs's care a note concerning the colon was made in 2,086 During his discussion he eliminated all the organic lesions from the group The functional groups were classified as colonic delay, irritable colon, mucomembranous colitis, and mucous colitis Coloptosis was not considered important so long as the colon passed on its contents normally An outline of the etiology and pathology, together with an analysis of the symptoms, signs, and radiological and sigmoidoscopic appearances, in 242 cases was given Treatment was fully discussed It was considered essential to allay anxiety, abolish purges, and regulate the patient's habits and life Surgery had no part in the treatment of these conditions

The discussion of Dr Spriggs's paper was opened by Dr E E CLEAVER (Toronto), who presented a masterly analysis of the physiological and anatomical facts about the colon known at the present day He was followed by Dr THOMAS MCCRAE (Philadelphia), who stressed the condition of the nervous system in these cases This, together with the abuse of laxatives, constituted most important etiological factors He drew attention to the popular misconceptions about constipation which were fostered by the press, by advertisements, and by misguided physicians There had sprung up in America a new fad in the form of hydrotherapy, and institutes devoted to colonic irrigation were patronized by well-to-do, idle people It was necessary, however, to be careful to exclude all possible causes in these cases, and not to forget the reflex disturbances of colonic function brought on by lesions elsewhere, not the least important of which was chronic prostatitis The less said about surgery the better in these cases Dr HUGH BARBER (London) discussed the evils of roughage diet and purgatives in constipation It was, he hoped, the medical profession's business to diagnose constipation and not the patient's The colon was not meant to be completely empty That "dangerous" condition, mucous colitis with spastic colon, which caused pain in the right lower abdomen, was often diagnosed by the patient as chronic appendicitis A full investigation was the first step towards recovery Professor T G MOORHEAD (Dublin) agreed with Dr Spriggs that the portion of the colon was of little importance, provided it sent on its contents It was, he felt, a great mistake to label a case as "dropped colon" The psychic effects of such a diagnosis were very serious indeed, and it was very difficult to convince the patient that the condition was of no account Dr Moorhead also entered a protest against the very handsome abdominal belts so often provided by the surgeon These belts, of course, were of great value in cases of real ptosis, but not for the "abdomen conscious" patient He felt that purgatives did a great deal of harm, especially in the more nervous type of individual There were, however, people who could tolerate daily purgatives for years without great difficulty He felt constrained to point out that the purgative was a most useful blessing to the out-patient physician, adding

that he had a short time before been asked to sign an order for his hospital for 55,000 laxative pills for use in the out-patient department Professor WILLIAM WRIGHT (London) stated that the action of the colon was essentially reflex, but that there undoubtedly was a conscious control as well As an example he quoted Maudsley, who had described a patient who could voluntarily procure an action of the bowels at ten minutes' notice Since the lower portion of the large intestine was under control of the pelvis, sympathetic reflex disturbances from prostatitis, etc, were indeed a possibility The rectal valves might well be potent sources of trouble in rectal stasis and abnormalities in the ampulla were another cause of trouble

Lord DAWSON spoke in appreciation of Dr Spriggs's paper and of the able and interesting discussion which had followed He felt that there was some justification in labelling these conditions for the benefit of the public which could not wholly understand the technical explanations which must always be given to the patient He felt that colitis was in many instances a colonic expression of deranged function elsewhere He described the spare, highly strung nervous individuals with flat abdomens, who were most often the victims of this malady These people were abdomen-conscious He contrasted these people with the vigorous plethoric individuals who were the victims of high blood pressure In his opinion these people more commonly had low blood pressures The strain of modern life was concentrated in their abdomens, one of the chief exciting causes was mental stress These were the days of increasing speed, and the rate of progress was outstripping the power of accommodation in these people They were often conscientious souls with a high sense of duty The chief thing to do was to bring the abdomen out of their realm of consciousness Anxiety was often a factor He stressed the importance of fatigue and cold They often ate when they were cold and tired and very hungry He felt that to give these people a detailed diet was to make them more conscious of their abdomens Dr KEATING (Chicago) discussed the history of constipation, and in humorous vein condemned the indiscriminate use of laxatives and pills Dr SPRIGGS, in reply said he had noticed that left sciatica and herpes were commoner in disorders of the sigmoid flexure He agreed with Lord Dawson that the blood pressure was low in these conditions In his series the average age had been 45 and the average blood pressure 128/77 He felt that one of the causes of flatulence might be the pump-like contraction of the bowel which emptied the veins and thus prevented abortion He had found arsenic useful in small doses and continued for three weeks

SEA-SICKNESS

An interesting series of papers on sea-sickness was given by Dr T GWYNNE MAITLAND (Liverpool), Group-Captain FLACK and Dr J R MARRACK Dr Maitland said that all the evidence—experimental clinical, and empirical—led to the inevitable conclusion that though there were contributory factors—ocular visceral, and metabolic—the underlying cause of sea-sickness was vestibular The subject of sea sickness presented more than usual difficulty owing to the fact that its inception was not a morbid process it was merely an over-excitation, though eventually it might indirectly exhibit morbid features, through what was called irradiation The vestibule was equipped to respond effectively only to short and abrupt kinetic changes of posture, and it would fail not only to register correctly any movement beyond this but such movement would if carried too far result in the symptom-complex of sea-sickness An interesting observation on the semicircular canals was that, while they represented in different measure every plane of movement they were very differently susceptible, and it was for this reason that the majority of human beings tolerated very badly postural movement imposed from without in the vertical planes

With rare exceptions they bore without noticeable distress movement in the horizontal plane as in waltzing and merry go-rounds There was the strongest possible presumption that this difference in susceptibility was due to education and habituation There was considerable evidence that a certain immunity could be developed against movement in the vertical planes—for example, in sailors, in lift attendants, and in the amusement park habitués Lacking training in these directions the intending sea voyager was often compelled to resort to prophylactic measures and to remedies when symptoms actually appeared It was here that the greatest care had to be exercised to decide on the remedy, in no case should a subject take for granted the absurd claims made for some of the proprietary drugs and remedies In bad cases his reactions should be the subject for most careful study—only then would the appropriate remedy be indicated and real relief obtained

SECTION OF SURGERY

Thursday August 28th

USES OF RADIUM IN SURGERY

On the second day of the meeting the Section of Surgery held a symposium on the uses of radium in surgery With one exception the contributors were British workers, and the discussion as a whole gave an adequate presentation of the recent work on radium in this country It was the more to be regretted, therefore, that no one was present who could give an account of radium treatment of cancer of the breast

The discussion was opened by Sir CHARLES GORDON-WATSON (London) who reported his recent work on the treatment of carcinoma of the rectum One of the great advantages offered by radium was the possibility of curing the disease without recourse to the colostomy that was inevitable during some stage of treatment when present-day surgical methods were employed The problem of radium *versus* surgery however, was complicated by the recent work of Cuthbert Dukes on the spread of cancer of the rectum This work suggested that it was not necessary to excise the rectum completely in order to obtain thorough eradication of an early carcinoma which had not penetrated the wall of the rectum If this work was substantiated it might be possible in the future to obtain a cure by more limited operations than were at present used, and without recourse to permanent colostomy There was no doubt Sir Charles said that an early growth of the rectum could be destroyed by radium without colostomy and without disturbance of the function of the rectum but no observations were as yet available on a five year basis The speaker had treated 121 cases of carcinoma of the rectum with radium Small growths could be destroyed with little or no resulting deformity of the rectum The adenocarcinomas varied greatly in their radio-sensitivity and it was desirable that attempts should be made to grade tumours histologically and to correlate such findings with the radio-sensitivity of the tumour Unexpected failure had been encountered in the radiation of early growths but fortunately these failures could be made good by surgery Rapidly growing adenocarcinomas in young people were more radio-sensitive than slow-growing tumours in elderly patients In these the dose of radium required to secure complete retrogression of the tumour was very near the margin of tolerance of healthy tissues and consequently radium burns were difficult to avoid Beta-radiation should be reduced to a minimum The speaker had used filtrations of 0 5 or 0 6 mm of platinum but in the future he intended to increase this filtration to 0 8 mm He left the needles in the tumour for ten days Radium was preferred to radon because of its uniform intensity of irradiation For tumours of the perineal portion of the rectum the results so far obtained were too uncertain to justify the preference of radium to surgery in the operable type of case Carcinomas of the rectum that lay above the peritoneal reflexion were treated by radium when the tumour was fixed or when in operable tumours the age or state of health of the patient forbade an abdomino-perineal excision Transperitoneal radiation was essential in these cases and it was a more risky procedure than perineal radiation for there was danger of infection and consequent paralytic ileus or general peritonitis Radon seeds were less dangerous than radium needles inside the peritoneal cavity but so far the end-results when radon was used were not encouraging Radon

of radium was also used inside the peritoneum for barrage treatment of the mesenteric glands The speaker mentioned one excellent result in which an inoperable tumour, fixed both to the bladder and to the sacrum, had been treated by radium needles, and the patient was alive and well, with a normally acting rectum, three years after treatment In other cases great symptomatic improvement had followed the use of radium Sir Charles then discussed squamous-celled carcinoma of the anus This tumour responded much better than any of the others so far considered, and in early cases immediate initial cure could be obtained by radium The consequent avoidance of colostomy rendered this method preferable to surgery The various methods and routes by which radium could be applied to carcinomas of the rectum were then discussed, and the speaker closed with a plea for team work between the physician, surgeon, pathologist, biochemist, and physicist, to enable the radium worker to conduct his practice on a scientific rather than on an empirical basis He also showed a film illustrating the implantation of radium needles into a rectal carcinoma by the perineal route

Radium treatment of carcinoma of the mouth and tongue was the subject of the next three papers, by Mr STANFORD CADE (London), Dr DOUGLAS QUICK (New York), and Dr G E BIRKETT (Manchester), whose paper was read by Professor BURGESS In many respects there was remarkably close agreement between these three workers, and as a result there emerged a fairly authoritative declaration on the radium treatment of buccal carcinoma For treatment of the primary growth all were agreed on the advantages of radiation over surgery, but whereas Mr Cade and Dr Birkett favoured radium needles, Dr Quick preferred radon seeds In the opinion of the first two speakers it was difficult with seeds to obtain a uniform intensity of radiation, not only because the intensity of the radiation rapidly diminished within a period of four days, but also because the small seeds could not be so accurately placed as the larger needles Carcinoma of the posterior part of the tongue, especially in or near the vallecula and the lingual tonsil was much more radiosensitive than the more differentiated carcinoma of the anterior part of the tongue, but it was prone to give rise to early metastases For the treatment of metastases of the neck that were operable, all the speakers favoured free surgical excision on the lines laid down by Crile They stressed the importance of very radical removal, and urged that the operation should be carried out only by those who were specially trained and practised in the performance of this operation An incomplete dissection of the neck was worse than useless When there were large inoperable metastases the glands should be actively treated by radium needles in large doses, and the balance of opinion favoured open operation as the method by which this treatment should be carried out For early cases in which no palpable metastases could be found there was sharp divergence of opinion as to the treatment of the neck Dr Birkett advocated a waiting policy, provided the patient reported for examination once a month Mr Cade and Dr Quick, on the other hand, believed that the neck should never go untreated Mr Cade advocated needling of the neck by the closed method, or, as an alternative, external treatment by means of a radium collar Dr Quick employed heavily filtered high-voltage x-radiation, and more recently a four-gram radium element pack Speaking of the radium bomb at the Westminster Hospital, Mr Cade felt that it was too early to form a judgement of its value, but he did feel that it was not an economic method of using radium, for the same amount of radium in the form of needles would treat ten patients where only one could be treated by the bomb Dr Quick stressed the importance of cleaning the mouth before treatment of the neoplasm was begun, and as a preliminary to irradiation of the primary tumour he recommended external irradiation of the neck and the site of the primary growth for a period of two weeks The results of treatment reported by the speakers cannot be adequately reported in abstract but the impression formed was that radium gave results that were definitely better than those of surgery alone, especially when it was remembered that healing was attained with no impairment of speaking, eating, or drinking Dr Birkett made a strong plea for the concentration of radium treatment at large centres

Mr FRANK KIDD (London) reported the results of treatment of 32 cases of carcinoma of the bladder by radon seeds after preparatory diathermy In some cases the treatment was administered by open operation, in others by the cystoscope Sixteen of the patients were alive and well for periods up to eight years, and two others were still living, but showed evidence of recurrence In some of the fatal cases the use of radon had appeared to accelerate the course of the disease It was sometimes difficult to estimate accurately the extent of the tumour, even at open operation, and the results were still not predictable with any certainty There had been some very encouraging results, and further work along these lines was indicated

Mr HUGH CAIRNS (London) reported on work done during the last three years in the use of radium in the central nervous system For a variety of reasons it was highly desirable that radium should be given an extensive trial in the treatment of malignant intracranial tumours These tumours were unlike most of those hitherto treated by this method, as they did not give rise to systemic metastases The greatest problem of the neuro-surgeon in doing radical extirpations of infiltrating intracranial tumours was to avoid maiming the patient by removing healthy nervous tissue If radium could be shown to have a selective action on malignant gliomas, a great advance would be achieved in the treatment of these tumours Results so far observed gave evidence that in certain types of tumour radium had a destructive effect It was too early as yet to pronounce on the results of radium treatment in this field In assessing the results it was necessary to distinguish clearly between the symptomatic improvement that followed relief of hydrocephalus and that which was actually due to destruction of tumour tissue The methods of using radium and radon in intracranial tumours were briefly described Mr CLIFFORD MORSON (London) discussed the radium treatment of malignant diseases of the genito-urinary tract By far the most favourable of all these neoplasms was carcinoma of the penis He had treated seven cases of this disease with radium, and had had six successful results The one failure had been due to pyogenic infection

Throughout the meeting emphasis was laid on the view that radium should not be regarded as a panacea for cancer The whole discussion was conducted in a critical spirit It was evident that much more work was necessary in all fields before the position of radium in treatment could be properly assessed, but the general attitude was one of cautious optimism

SECTION OF OBSTETRICS AND GYNAECOLOGY

Thursday, August 28th

ALBUMINURIA OF PREGNANCY

AN exceptionally large number of members and visitors, under the chairmanship of Professor D S MACKAY (Winnipeg), heard Mr J BRIGHT BANISTER (London) open the discussion on the commonest abnormality in pregnancy and labour and its late results In a series of 6,000 cases of pregnancy which he had investigated he found that some 30 per cent suffered from albuminuria, the majority being transient only He pointed out the difficulties met with in following out the after-histories, it was because records were incomplete that so little was known on the subject All investigations should cover a period of at least five years, and the collaboration of a general physician should always be obtained in treating a case of albuminuria of pregnancy after delivery if dire consequences were to be eliminated Cases might be classified, as suggested by Dr Standen, into (1) those in which albuminuria existed with vomiting in pregnancy, (2) cases with a low kidney reserve, (3) cases of true nephritis complicating pregnancy, (4) cases of pre-eclampsia, (5) eclampsia In approaching the subject the lecturer set himself several questions Was a patient who developed albuminuria likely to suffer from a recurrent

attack in a subsequent pregnancy? Was a patient with chronic nephritis likely to suffer from progressive deterioration of kidney function during a future pregnancy? Did eclampsia recur? What place did albuminuria of pregnancy occupy in the etiology of chronic nephritis? He investigated the records of 30 000 cases of pregnancy in various London hospitals, and found 1 700 of them required some treatment during the pregnancy, and in 86 per cent of these albuminuria recurred more or less severely in subsequent pregnancies The conditions from which these patients suffered were too varied to permit of precise conclusions, but he had arrived at certain general answers to the questions set He did not believe that a patient developing albuminuria in one pregnancy was particularly liable to a similar complication in a subsequent gestation if she belonged to the low kidney reserve group Cases of chronic nephritis would have the condition aggravated by a subsequent pregnancy He thought that some 30 per cent of cases of pre-eclampsia and eclampsia suffered from some toxic condition in a subsequent pregnancy He considered that the shorter the time the albuminuria persisted the less was the risk of the complication in a subsequent pregnancy Raised blood pressure was the most significant clinical sign In cases in which the blood pressure was up to 150 for any length of time the damage was probably permanent, and there was likely to be trouble in a subsequent pregnancy In considering how future recurrences might be prevented Mr Bannister stressed early diagnosis and early and thorough energetic treatment This treatment should not be carried on medicinally for too long and should recover not occur in about seven days then radical treatment should be chosen He felt that Caesarean section might have a place in the treatment of the severe toxaemias of recent origin He mentioned the frequency of mental symptoms in albuminuria and concluded by stating that in the light of present knowledge it was impossible to state what was the part played by albuminuria of pregnancy in the etiology of chronic nephritis

Professor O BJÖRNSSON (Winnipeg) was in agreement with most of the points mentioned, and particularly with reference to the evil results of delaying the induction of labour or institution of therapeutic abortion He regretted that Mr Bannister had not outlined his treatment in these cases Dr J HOLLENBERG (Winnipeg) asked the opener about his experience of the value of Stroganoff's treatment in albuminuria of pregnancy Mr ERIC STACEY (Sheffield) discussed cases of albuminuria of pregnancy associated with some form of ante partum haemorrhage In the term 'toxic haemorrhagic states" he included cases of accidental haemorrhage with or without albuminuria in which there were evidences of a toxaemic state often expressed only by high blood pressure, and cases of what he called toxic placenta praevia By the latter term he referred to those cases which, while inevitably bleeding from the abnormally situated placenta, showed signs of a toxic state by oedema, albuminuria, high blood pressure, and other symptoms of pre-eclampsia In a follow-up of a series of roughly 500 of these cases he had found that toxic conditions occurred in 37 per cent of the patients who had a subsequent pregnancy He considered that the raised blood pressure was the most important danger sign rather than the albuminuria, and referred to the frequency of mental aberration in toxic pregnancies and the danger of recurrence if a future pregnancy had an associated albuminuria He disagreed with Mr Bannister about the short period of treatment he would allow before considering therapeutic abortion or induction and felt that with a rigid rest and dietetic treatment many of the patients could be prevented from suffering permanent damage, except such as already existed and at the same time have the satisfaction of delivering a living child He asked Mr Bannister to pronounce his views on this matter more definitely in case error had arisen

Professor HILDING BERGLUND (Minnesota) pleaded for rather more conservative treatment than that advocated by the opener, and only induced when there was deterioration of the patient's condition or a persistence of the high blood pressure for six to seven weeks He was struck by the fact that even when albuminuria could be eliminated by treatment on whatever lines, certain cases tended to persist with nephritis subsequently, and ended fatally with uraemia from three to nine months later On the other hand, he had known patients to carry on their vocation in life for thirty years with a progressive nephritis which had started with a pregnancy, and felt that repeated pregnancies in these conditions led to permanent damage to the kidneys Dr T G STEVENS (London) believed in early termination of pregnancy in cases of severe albuminuria, but felt that Caesarean section held no place in its treatment Dr MARGARET BASDEN (London), on the other hand, said she treated these cases for twenty-four hours medicinally and, failing improvement, induced If during that time the patient's condition became worse she always performed Caesarean section as better in the interests of the child, and she had not had a fatal case when exploiting this method of delivery

The President, Mr COMYNS BERKELEY in the course of a historical review, said that Kellogg gave the name recurrent toxaemias of pregnancy" to those cases which gave no clinical manifestations of chronic nephritis when not pregnant, and thought that 8 to 15 per cent of pregnancy toxaemias belonged to this group He thought that these might turn out to be cases of a faulty kidney balance which when the load of pregnancy was added, developed kidney insufficiency Stander and Beckham had described a group, called low reserve kidney, which appeared to be the same Young believed with Kellogg that women with a toxaemic history had resident within their bodies some morbid influence an *x* factor not inconsistent with good health in non pregnant women, but inconsistent with the normal continuance of pregnancy to term because of placental damage, which he thought was the cause of eclampsia He suggested that this *x* factor might be of an infective nature—for example, chronic endometritis, metritis in primiparae Gibberd did not agree with these views He found that in 13 per cent of patients who had had at least two pregnancies all of whom had healthy kidneys, signs of renal damage persisted for a year or longer after the termination These therefore had become chronic nephritics The average time between the first appearance of albuminuria and the termination of pregnancy was nine weeks In the remaining 41 cases there were 27 in whom the first albuminuric pregnancy was terminated later than three weeks Of the first group terminated within three weeks and 14 in whom it was 40 per cent, and of the second 70 per cent had albuminuria in the next pregnancy which suggested that the rate of recurrence could be related to the duration of the albumin su[illegible] Mr Comyns Berkeley believed that he had obtained [illegible]idence showing that in all cases in which toxaemia occurred in successive pregnancies there was a pre-existing chronic renal damage not detected by the ordinary methods of clinical examination

Dr S KORENSKY (Winnipeg) thought that induction should not be resorted to too early, as many of the patients continued with the condition subsequently, and asked whether Mr Bannister had tried treatment with magnesium sulphate Mr BANNISTER in replying wished to make it clear that he considered Caesarean section in these cases of albuminuria should be reserved for certain severe fulminating cases of pre-eclampsia only He had no experience of the use of magnesium sulphate but having seen Stroganoff working, felt that if his treatment was carried out as done by him the results were excellent

HYPERTONIC SALINE IN PREGNANCY TOXAEMIA.

Professor V J HARDING (Toronto) then described experiments carried out by himself and Dr H B VAN WYCK (Toronto) on the effects of hypertonic saline on toxaemias of later pregnancy Four years had elapsed since they had described the use of salt-free diet in the treatment of pre-eclampsia and since then they had reinforced their conclusions by observations on the use of sodium chloride intravenously The object of the older methods of treatment—namely water purging venesection hot packs—was to remove toxins but at the same time they removed body fluid The administration of hypertonic saline solutions might produce oedema in cases complicated by parenchymatous nephritis, but to relieve

convulsions and high blood pressure was considered worth while at the cost of a little oedema In the speaker's view, valid though such arguments might sound, the use of hypertonic saline solutions in the toxaemias of later pregnancy was harmful, and he cited cases in which this treatment had undoubtedly aggravated toxaemia Their observations contraindicated the use of hypertonic saline solutions in post-operative work in toxaemic pregnancy unless the pregnancy was to be simultaneously terminated Their more recent observations had led them to conclude that a high intake of salt at the time of a developing toxaemia might rapidly produce fulminating eclampsia Salt restriction was a necessary part of pre-natal care, protein was harmless They conceived the toxaemias of later pregnancy as due to a fundamental disturbance of water distribution which might be associated with water retention Such a disturbance might show itself as epigastric pain and vomiting, albuminuria, hypertension, oedema, convulsions, or peripheral liver degeneration, alone or in combination Dame Louise McIlroy (London) said that here was a definite scientific pronouncement on what she had maintained from clinical experience—namely, that administration of intravenous saline where a toxic state existed was contraindicated, she relied on colonic lavage She then showed two cinematograph films (1) classical Caesarean section performed at the Royal Free Hospital, London (2) method of resuscitation of the newborn in a case of asphyxia after forceps delivery, also at the Royal Free Hospital

SECTION OF BACTERIOLOGY, PATHOLOGY, PHYSIOLOGY, AND BIOCHEMISTRY

Thursday, August 28th

Immunological Problems in Septicaemia

Professor William Boyd (Winnipeg), Vice-President of the Section, presided at the second session Professor Fred T Cadham of the University of Manitoba opened a discussion on some immunological problems in septicaemia His paper appears in full in this issue at page 460 Professor G S Wilson (London) expressed his diffidence in dealing with a subject of which he had had very little direct experience He wished to know whether in the titration of complement allowance had been made for the natural sheep antihaemolysis, which is present in normal human serum, and which is known to show considerable variations even in health In order to assess the significance of the difference in complementary titre between groups of normal and of diseased persons it would be of great value if Professor Cadham would publish his exact figures, so that the standard deviation of the difference between the means might be worked out The evidence that a parallelism existed between the complementary titre and the degree of immunity was not very satisfactory, and the work of Gunn, particularly in relation to enteric fever, was by no means favourable to this conception In severe, and often in fatal, cases of this disease, the complementary titre might be very much above normal, indicating that failure to establish immunity was not due to insufficient complement Since complement was active only in association with immune bodies, it was clear that in order to obtain information of value, it would be necessary to determine both the complementary and the antibody titre of the serum The little evidence we possessed in favour of the value of the antibacterial serums pointed to their action being specific, and it was noteworthy that the beneficial effect of antipneumococcal and antistreptococcal serum appeared to depend on the presence of precipitating and antitoxic antibodies respectively, neither of which required the co-operation of complement Professor Cadham's results were very striking, but it was not clear that the explanation which he had put forward was able to account for the facts

Professor Oliver S Waugh dealt with the subject from the clinical point of view While only one case of Cadham's series was his own patient, he had seen a large number of the series To the surgeon an acute progenic infection was of grave importance, leading to apprehension, the methods previously available for combating such an infection had been largely empirical Vaccines had not been beneficial in acute conditions, and chemotherapy and other treatments were disappointing or useless, 80-90 per cent of such cases proved fatal Professor Cadham would appear to have used the body as a human test tube to build up a lytic reaction against the invader Some of the recoveries obtained in Winnipeg by his treatment had been astonishing, especially since the method had for the most part been used as a last resort, and some of the patients had been unconscious and in an extremely alarming condition Dr Waugh stressed the importance of early diagnosis and treatment of various foci as potential sources of septicaemia

Professor Robert Muir (Glasgow) expressed high appreciation of the painstaking work that Professor Cadham had reported He considered it important to try to understand exactly what we meant by septicaemia There were two extreme types of bacterial invasion of blood one, exemplified by typhoid fever, in which the bacterial invasion was reduced as rapidly as it occurred, the other, a more rapid invasion leading frequently to a rapid fatal termination Clinical cases presented all intermediate stages, and septicaemia remained a very hazy term It was essential to recognize that phagocytosis was all important for destruction of organisms, and he considered that complement was not so important as antibodies for recovery The raising of the complement titre observed by Professor Cadham he regarded as an important biological observation In septic infections there were many borderline cases and a little something to help might make all the difference Professor William Boyd (Winnipeg) thought that immunologists should not overlook entirely the findings of morbid anatomy in connexion with their work Professor Cadham, in the course of his reply, stated that he could not entirely agree with the view that complement was not involved in the toxin-antitoxin reaction He would not wish to advocate his type of treatment as the most desirable, but hoped that the discussion would prove to have been useful

Physiology of the Parathyroid Glands

Professor J B Collip of McGill University, Montreal, opened the discussion on the physiology of the parathyroid glands He dealt particularly with the more recent developments in this field The function of the parathyroid apparatus was apparently directed towards the maintenance of a definite level of total calcium in the circulating plasma, and was subserved by the action of the internal secretion elaborated by the glands He dealt with the general metabolism of calcium, its different physiological roles, its absorption and excretion, and the relation to it of the metabolism of phosphorus, especially in parathyroid deficiency In connexion with the preparation of the hormone he stressed the fact that preliminary hydrolysis with very dilute hydrochloric acid (3 per cent) for forty minutes on a boiling water bath gave the most potent extracts, prolonged acid hydrolysis destroying the active principle Purification had not yet been carried beyond a proteose-like fraction Either the hormone itself was of protein nature or else it was intimately associated with such a substance Trypsin and pepsin destroyed the activity, and no effective method of oral administration had been obtained The physiological effects and the pathological effects of overdosage were reviewed In such overdosage there was marked increase in the calcium content of kidney tissue, other glandular tissue being practically unaltered in this respect Hunter's study of generalized osteitis fibrosa was referred to and also other diseases affecting calcium metabolism or inducing tetany The interrelationship of the parathyroid secretion and vitamin D was discussed

Professor V H K Moorhouse (Winnipeg) discussed the mechanism of secretion by the parathyroids To what stimuli was this secretion a response? There were nerve fibres along the course of the blood vessels, apparently autonomic and probably arising from the cervical sympathetic It still remained to be ascertained whether excitation of these would induce the secretion The

chemical excitors, if there were such, were unknown Perhaps the level of blood calcium was the determining factor The actual manifestation of tetany was characteristic of a nerve protoplasm disturbance Excitation of nerve muscle became increased about ten times over normal It could be observed after section of the nerve, and up to the time of its degeneration The peripheral nerves were not the only sites of disturbance following parathyroidectomy Chronaxie was lengthened, suggesting lowering of excitation, and this observation could not at present be easily correlated There were sensory and afferent as well as motor disturbances In dogs and cats intense irritation about the mouth and nose was observable The loss of appetite and vomiting seen in such animals following parathyroidectomy were probably due to effects on the nerve centres in the mid brain and medulla There was a general involvement of the nervous system but different parts were unequally affected

Professor J C MEAKINS (McGill University) considered that the criterion of disturbance of parathyroid function was to be found in the study of blood calcium and calcium balance, although the latter was open to many fallacies There were six diseases associated with disturbance of calcium metabolism parathyroid deficiency (spasmodic tetany) nephrosis steatorrhoea with megalocolon, infantile rickets osteomalacia and generalized osteitis fibrosa (von Recklinghausen's disease) Of these only two were associated with lesions of the parathyroid parathyroid tetany, and its antithesis, generalized osteitis fibrosa There had been considerable confusion in the study of the latter and of osteomalacia and this must be borne in mind in utilizing the earlier literature In nephrosis with a calcium deficiency there was usually a good response to parathyroid therapy, though the cause and effect were not yet known

Dr D ROY MCCULLAGH (Cleveland Clinic) reported the findings in a series of cases exhibiting parathyroid deficiency following operation studied by himself and Dr E P McCullagh they had endeavoured to find means of controlling phosphate metabolism in this condition They observed that while many such cases exhibited a constant low level of serum calcium the patient's tetany symptoms varied from day to day parallel with the serum inorganic phosphate In normal sugar tolerance curves it was well recognized that as the blood sugar rose the phosphates showed a slightly delayed fall In post-operative parathyroid tetany the relationship was somewhat emphasized As the phosphate fell the neuro-muscular excitability lessened An attempt had been made to apply this finding to treatment After a carbohydrate meal the symptoms were greatly but only temporarily relieved calcium gluconate was ineffective, but administration of lactose had been found to give very beneficial results, these being accompanied by a slow steady fall of blood phosphates

Professor A T CAMERON (Winnipeg) referred to results he had obtained showing that the blood calcium of normal young rats was below normal, and at a level associated with tetany, for a large part of the year, though open tetany was never manifested The explanation obviously seemed to be a dietary deficiency in vitamin D and he reported results recently obtained by one of his students Mr C F Code, supporting this view In these animals the blood calcium could be maintained during winter at maximum or normal levels by giving food irradiated from a carbon arc lamp or by adding irradiated ergosterol to the diet Numerous observations by various workers had shown beyond doubt that marked overdosage of the vitamin would considerably increase the plasma calcium Since, however, over a considerable range of vitamin dosage the blood calcium remained constant whereas any injection of the parathyroid secretion had its effect the inference was reasonable that the main control over the height of blood calcium was exercised by the vitamin perhaps through the parathyroids The available evidence bearing on the effect of vitamin dosage and overdosage following parathyroidectomy was quite conflicting while little if any work seemed to have been done to ascertain the result of continuous parathyroid injection in experimental rickets, and the speaker suggested that study of these problems might well throw much greater light on the whole problem of calcium metabolism

Thursday, August 28th

THE CLASSIFICATION OF BRAIN TUMOURS

THE chair was taken by Dr A T MATHERS Vice-President of the Section, who, in introducing the speaker, gave a brief historical sketch of the subject Dr WILDER PENFIELD (Montreal) commenced by saying that to be of more than academic interest, a classification of brain tumours must group together neoplasms whose biological behaviour and histological structure had certain similarities Any other type of classification was, he considered of little value from the standpoint of treatment and prognosis Tumours of the brain might be considered first under two main headings (*a*) gliomas and (*b*) tumours of the sheaths of the nervous system which were encapsulated After referring to much of the work done by others in the study of gliomas the speaker submitted the following as the most useful and simple classification of these tumours (1) neuro-epithelioma, (2) multiform spongioblastoma, (3) medulloblastoma, (4) oligodendroglioma, (5) polar spongioblastoma, (6) astroblastoma, (7) astrocytoma and (8) ependymoma The pathology of these types was described in great detail and clinical examples of each were presented and well illustrated by slides Tumours of the sheaths of the nervous system the speaker thought had generally been better recognized than the gliomas, though the cytological interpretations had been curiously varied These tumours, he considered, could best be classified as follows (1) meningeal fibroblastoma, (2) perineural fibroblastoma, and (3) neurofibroma of von Recklinghausen's disease Considerable time was given to a discussion of the histology of sheath tumours, and clinical cases in which operative treatment had been most successful were cited In concluding, it was urged that technical excellence in neuro-surgery was not enough It was necessary that the surgeon himself should understand as nearly as possible the characteristics of the lesion he would combat, and that clinical judgement and therapeutic insight should be based upon discriminating histological study The classification presented was only one of a number of possible ones but it had in its favour the fact that it had withstood the test of practical clinical application

Dr R G ARMOUR (Toronto) followed by congratulating the speaker on the excellence of his presentation Dr HENRY WOLTMAN (Rochester Minn.) commented on the classification of tumours presented and cited a number of clinical cases which had been operated on at the Mayo Clinic Operative treatment he pointed out had done much to prevent blindness in cases which, at one time, would have gone into darkness with no hope of relief He referred to x ray therapy of certain cases, and stated that he was of the opinion that the more embryonic the structure of a tumour, the more responsive it was to this type of therapy He had noted also that in certain cases where operative treatment had been carried out, the tumour was subsequently found to have altered in histological structure The newer studies in tumours of the brain he maintained, might do much to settle medico-legal disputes about injury as a possible etiological factor in the development or tumour SIR JAMES PURVES-STEWART (London) urged that it was now the duty of the diagnostician not only to localize the lesion in the brain but also to make a pathological diagnosis This he contended was essential because there were many cases in which complete removal of the tumour should be done immediately whereas there were others in which nothing more than a decompression should be attempted He complimented his Canadian colleagues on their diagnostic technique in the use of ventriculography and encephalography and stated that it was unfortunate that often in Great Britain these diagnostic aids were not adopted early enough He stressed the use of both methods of diagnosis pointing out that when it was suspected that the tumour was subtentorial, a ventriculography should be done but if it was thought that the tumour was supratentorial, an encephalogram should be the method employed Work like Dr Penfield's, Sir James felt, was a stimulus to them all.

DR ADSON (Rochester, Minn.) commented on the opener's classification, and said that Dr Penfield's work was doing much to clarify diagnostic difficulties. A diagnosis based on an understanding of pathology he considered as sound. What the surgeon wanted to know was (1) Was the tumour encapsulated? (2) Was it removable? His experience of many years as a neuro-surgeon had made him much more conservative than once he had been. In view of the fact that all cases of brain tumour did not go on to death, but that many enjoyed life expectancy, radical surgery was, he felt, not always indicated. The pendulum had in recent years been swinging in the direction of radicalism, but the time would come when they would become as conservative in their judgement as if the operation was to be performed on themselves. DR WILLIAM BOYD (Winnipeg), who had been acting as chairman to the Pathology Section, arrived at this time, and expressed his regret at having missed the main part of the discussion. He commented on more modern methods of staining nervous tissues, and asked if Dr Penfield could explain why one so frequently found hydrocephalus associated with brain tumours. DR PENFIELD, in reply, said that he had been greatly interested in Sir James Purves-Stewart's remarks on diagnostic methods. Where ventriculography was employed, he considered it should be followed immediately by operation. He concurred with Dr Boyd in his observations regarding the association of hydrocephalus and brain tumour, but did not feel that he could offer a satisfactory explanation of the phenomenon.

SECTION OF PREVENTIVE MEDICINE.

Thursday, August 28th

THE LABORATORY IN A SCHEME OF PREVENTIVE MEDICINE.

THE members of the Section met, with Professor A. J. DOUGLAS (Winnipeg) *in the chair*. The subject was introduced by Dr. W. G. WILLOUGHBY (M.O.H., Eastbourne) in a paper which was published in full in the *Journal* of September 13th at page 418. The CHAIRMAN expressed the appreciation of the Section in receiving this paper from the President-Elect of the Association. DR. M. R. BOW (Alberta) said that in providing efficient laboratory service for small urban and rural districts he had found that the plan of employing the municipal hospital laboratory for public health purposes (on a sliding scale of charges) had worked most satisfactorily. This arrangement gave the hospital laboratory workers the preventive viewpoint. To discourage the use of inadequate doses of diphtheria antitoxin no packages containing less than 20,000 units were distributed. In remote districts diphtheria patients were released after three weeks' quarantine without swabs. In districts accessible to a laboratory two negative cultures were required. DR. A. S. M. MACGREGOR (Glasgow) referred to the function of the laboratory in dealing with the problems of bacteriological immunity. He described the situation that had arisen under the Local Government Act, which enlarged the scope of the medical work of local authorities in Great Britain. One of the problems of the future would be how to take full advantage of the facilities for research which these new responsibilities would provide. This branch of preventive medicine should develop in co-operation with all the other laboratory facilities in the area. DR. J. T. PHAIR (Ontario) stated that the provincial department maintained a central laboratory at Toronto, with some seven branches placed at strategic points in the province. The service was gratuitous and largely used. During the last two months a full-time pathologist had been added to the staff, and the department was now prepared to offer further assistance to the general practitioner by examining pathological tissue of any type, for this service a fee of one dollar per specimen was charged. Professor J. S. FITZGERALD (Toronto) emphasized the value of the early administration of a large dose of antitoxin in every case in which the practitioner had reason to suspect that the patient was suffering from diphtheria, regardless of the result of the examination of the material submitted to the laboratory. DR. JAMES ROBERTS (Hamilton) held that the laboratory should be situated within easy access of the building in which the work of the administrative health officer was carried on. Schick and Dick tests to determine the susceptibility of contacts were preferably done by a laboratory expert, and the number of such examinations, with others such as those for ringworm in school children, was found to be materially increased if the laboratory service was readily available to the executive officer. The general public was entitled to the financial saving which followed lessened detention of suspects and contacts when frequent use of the laboratory was made, and this should be pressed for by the chief of the department. DR. A. GRANT FLEMING (Montreal) gave it as his experience that practitioners did not often expect the laboratory to make a diagnosis, and that in this matter the form of the report was of some importance. He asked whether in England the release swabs after diphtheria attacks were taken by the private physician or the public health officer. DR. ALFRED GREENWOOD (M.O.H., Kent) expressed his appreciation of Dr. Willoughby's paper. The bacteriological laboratory in the county of Kent examined 25,000 specimens annually for 1,100 general practitioners in the county free of charge. The laboratory should be considered primarily as an aid to diagnosis. He emphasized the desirability of injecting large doses of antitoxin in diphtheria at the earliest possible moment without waiting for a report from the laboratory, and even after negative reports where the clinical signs suggested a diphtheria infection.

PASTEURIZATION IN A SCHEME OF MILK DISTRIBUTION.

The paper read by DR. A. S. M. MACGREGOR (M.O.H., Glasgow) in opening this discussion appears in full at page 463. DR. M. R. BOW (Alberta), who followed, said it was the duty of the health department to ensure a safe milk supply. While theoretically pasteurization was undesirable, in practice it was to be given a definite place in any scheme of milk distribution. Clean milk was not necessarily safe milk, though all measures to improve the cleanliness of the milk had to be encouraged. The need for continuous careful supervision of pasteurizing plants by health authorities was shown by a recent disastrous typhoid epidemic in Montreal. Without this precaution there was a most dangerous sense of false security. Apart from its effect on vitamin C, it appeared that the process of pasteurization did not impair the nutritive value of milk, fruit and vegetable juice could be given to the child to make good this deficiency. For efficient pasteurization the milk had to be held at the required temperature for a sufficient length of time and then rapidly cooled. The experience in Canada had been that wherever scientific pasteurization had been employed milk-borne infections had been reduced to a remarkable degree. The degree to which the process was used differed widely in different parts of the country. Professor J. S. FITZGERALD (Toronto) referred to the work of Dr. Ray Price in Toronto on strains of *B. tuberculosis* isolated from children suffering from non-pulmonary forms of tuberculosis. These children were admitted to the hospital for sick children both from communities in which pasteurization laws were and from those in which they were not in force. DR. GRANT FLEMING (Montreal) welcomed Dr. Macgregor as a supporter of pasteurization. He did not believe in milk grading, but urged that *all* milk should be pasteurized certified milk. Certified milk was not safe, because of the human element. Pasteurization destroyed not only the tubercle bacillus, but pathogenic organisms responsible for other communicable diseases. The CHAIRMAN summed up briefly, and expressed the opinion that all milk should be pasteurized, scientifically and under official supervision, in order to obtain the best results. DR. MACGREGOR, in reply, expressed his appreciation of Dr. Bow's contribution as a clear and inspiring exposition of the subject. He stressed once again his view that clean milk was not necessarily safe milk. In Great Britain the big milk distributors had adopted pasteurization for commercial reasons. The impulse to such measures had diminished, however, with the production of cleaner milk. The public was confused by official "grading." The higher grades were unpasteurized, and their increased production would diminish as more pasteurized milk was consumed.

MR. J. GIBBARD (Ottawa) read a paper entitled "[illegible] phoresis of *Neisseria intracellularis* (meningococcus)

SECTION OF OPHTHALMOLOGY

Wednesday, August 27th

THE CONTROL OF TRACHOMA

At the opening meeting of the Section the President, Mr N BISHOP HARMAN invited the members to congratulate Dr Harvey Smith (Winnipeg) on his election as President of the British Medical Association for the coming year It might well be accounted an honour, not only to the recipient, but also to the Ophthalmological Section, of which he was a member Professor HERBERT BELL (Winnipeg) then took the chair, and Mr HARMAN read a very interesting paper on the control of trachoma, which will be found printed in this issue at page 457

Mr A REID MOODIE (Dundee, Scotland) discussed the value of the various measures already in existence He believed that compulsory notification was a valuable weapon in the fight against trachoma It had been adopted in twenty-four countries, but in Great Britain Glasgow alone had made the disease notifiable, and it was always followed up in that city by treatment under the supervision of an ophthalmic surgeon During the first six years of compulsory notification in Glasgow (1914–19) the average number of cases notified was seventy four while in the period 1924–29 it was forty two, a decrease of 39 per cent , 39 per cent of the cases occurred during school age Nearly all the patients (99 2 per cent) came from houses of three rooms or less, and the incidence among inhabitants of one and two-roomed houses was almost double that among families occupying three rooms Dr Wibaut, at the Amsterdam Congress, had determined for each country its trachoma index, and with its aid had classified the countries into seven groups, with indices ranging from 0 1 per cent as in Great Britain and Germany, to over 61 per cent as in Egypt and Palestine A chart illustrating this grouping was shown Antitrachoma measures in Amsterdam included the regular inspection of school children, the keeping of a trachoma register, and semi compulsory treatment In Italy, Government subsidies were granted to local authorities to provide free ambulant and hospital treatment, there were also university courses for the training of medical practitioners in early diagnosis The United States, in addition to immigration restrictions, had instituted propaganda by lectures and literature Infected areas were visited by teams of medical specialists and nurses, whose visits, when considered necessary, were followed by the arrival of a mobile dispensary in the form of a rail car fully equipped for carrying out treatment In Japan very wide powers had been delegated to administrative bodies, enabling them to carry out a general medical inspection when considered necessary The poor received free treatment and instruction in prophylaxis Mr Moodie thought it might be useful for countries to offer prizes for scientific research

Dr WHITESIDE ROBERTSON (Guernsey) gave particulars of the International League against Trachoma which he had received from Dr Wibaut of Amsterdam this had now come into being in Geneva (*Journal*, August 30th p 328) He outlined the objects of the league, and the action intended to be taken It was proposed to notify the different Governments of the establishment of this organization, to point out the devastating and contagious nature of the disease, and to ask for moral and if possible, financial support The league hoped to advance the co-operation of different organizations to inaugurate a centralized campaign, and when necessary to give advice about the best measures for controlling the disease It was proposed to form a library on trachoma by asking authors to send reprints of any articles or books on the subject Dr Whiteside Robertson described the ophthalmic schools at Swanley in Kent, and eulogized the work of Mr Stephen Mayou, who had control of them For a country in which the incidence of trachoma was low, Swanley could well be taken as a model A number of excellent photographs of the homes were shown The secretary read a communication from Mr Stephen Mayou, in which he stated that in conjunction with Dr McCartney, pathologist to the Metropolitan Asylums Board he had carried out investigations, but that they had failed to isolate the *Bacillus granulosis* of Noguchi In one instance a kindred organism had been isolated, which probably belonged to the xerosis group They had failed to inoculate trachoma directly from the patients into monkeys They had also experimented with the organism sent by the Rockefeller Institute, and had failed to reproduce trachoma in monkeys with their organism, although some redness and slight follicular enlargement was apparent for a week or so after inoculation Ordinary monkeys kept in a dirty condition, or in cages with sawdust or sand, were liable to get some follicular enlargement from irritation Professor JACKSON (Denver, U S A) said that the American experience of trachoma had emphasized its contagious nature and the factor of family or racial immunity In the Southern States the negro living in large numbers and always gregarious, imported from Africa under general conditions as bad as those of immigrants from Southern Europe and largely segregated from the whites as were the Indians, had remained practically free from trachoma Cases occurred in them, but very exceptionally and rarely among those of mixed blood. The American Indians were very subject to trachoma, which had increased rapidly among them in the last century, until now a few hundred living on the shore of Lake Superior were reported as the only tribe free from the disease In Philadelphia, forty years ago, all the cases of acute trachoma occurred in recent immigrants In Colorado in the last thirty years most of the cases had been in the Indians chiefly segregated on reservations The belt of what might be called indigenous trachoma in the United States began in the Southern Allegheny Mountains, and among the whites more purely British in origin than any other part of the population of the United States The worst family and locality endemics had been found in the mountains of Kentucky and North Carolina Professor Jackson discussed next the relation of the Noguchi bacillus to trachoma Noguchi had obtained it from five Indians suffering from this disease in New Mexico and Arizona, and had termed the small slender organism *Bacillus granulosis* a name that had helped to favour the idea that it was connected with follicular disease of the conjunctiva other than trachoma It had never been found in any other disease of the human conjunctiva, as had the so-called inclusion bodies of Prowazek and the blue bodies of Lindner It had been found in trachoma in patients other than Indians in the United States and in North Africa It had been isolated in pure culture, transmitted through many generations and its inoculation gave rise in monkeys to a disease very closely resembling that produced by inoculations with material from the trachomatous conjunctiva In at least two instances of inoculation into the human conjunctiva it had also originated a disease which resembled early trachoma in man From watching the dozen monkeys which had been inoculated by Drs Finnoff and Thygeson, the speaker's belief was that the Noguchi bacillus was probably the cause of trachoma. He thought that a general search for this bacillus should be made in all cases of this disease

Dr A J BALLANTYNE (Glasgow) said he had been unable to satisfy himself of the infectivity of the disease He had been struck by the marked difference in individual cases in epidemics of conjunctivitis occurring in school convents etc and he thought that in cases termed trachoma on there might be more than one infection He considered the tissue reaction a most important factor in determining the disease He had experienced great difficulty in tracing the origin of the infection in sporadic cases Mr ARNOLD W ORMOND (London) believed that many cases called trachoma were simply follicular conjunctivitis and he was no single factor which could conclusively prove a patient was suffering from this complaint he regarded epidemics of the disease as due to a mixed infection In his own experience he had not had a single case of a person blinded by trachoma He agreed with Dr Ballantyne in considering that the soil was a matter of the most

importance Dr AUSTIN A HAYDEN (Chicago) described his own personal experience in contracting the disease while a house-surgeon in York In the act of expressing follicles in a case of trachoma some fluid from the patient had accidentally entered the speaker's eyes, and although they had been washed out within half an hour, he contracted the disease, which was well developed in five weeks He had known other doctors who had contracted the disease in a similar way, and whose general health, which was excellent, could not possibly have aggravated the condition He strongly recommended the use of protecting goggles in dealing with cases of trachoma

COLOUR VISION

Professor FRANK ALLEN (Winnipeg) read a most suggestive paper on certain aspects of colour vision The conclusions drawn had resulted from extensive laboratory researches, and he viewed the subject from the standpoint of the physicist He emphasized the fact that he had been able to show that colour vision conformed to other sensory and secretory reflexes

Thursday, August 28th

INCIPIENT CATARACT

The second session of this Section was devoted to a discussion of the management and treatment of incipient cataract The paper of the opening speaker, Mr L V CARGILL (London), was printed in the *Journal* last week at page 419

Professor T HERBERT BELL (Winnipeg) reported three cases in which he had endeavoured to treat incipient cataract by one of the new methods, in two there had been apparent success, but the other was a complete failure The treatment followed had been characterized by Mr Cargill as useless, but he could not subscribe to that statement, nor could he absolutely controvert it, his first two cases certainly encouraged him, however, to make further attempts in suitable conditions The method he followed was that described by Davis of New York—the hypodermic injection of lens antigen, with dietary regulation, and attendance to the general health A manœuvre which he had occasionally found useful in cases of early central opacity, where the patient had attained some improvement of vision under a mydriatic, was to perform a double preliminary iridectomy He had not wandered so far as had Mr Cargill from the precepts of their mutual teacher, the late Professor MacHardy, since he occasionally made use of a slight trituration of the more affected eye, so far he had had no bad results, but a more rapid maturation of the cataract, with greater ease of extraction Mr A W ORMOND (London) discussed the various procedures which he had tried He had carefully watched many cases in which drops of potassium iodide, lens antigen, and the other treatments had been employed, but had been unable to satisfy himself of the efficacy of any local measure He had not seen any case in which the lens opacities had retrogressed He had experimented with the administration of paraphakin, and had also been disappointed in that method of treatment Focal sepsis was of the greatest importance, it seemed to influence the incidence of cataract and also its treatment In certain specified cases he advocated the artificial maturation of the lens Mr Ormond agreed with Mr Cargill that it was most unfortunate that they were tied to the term "cataract," which was applied to any lens opacity, patients had frequently come to him in a very nervous and anxious state, having been told by opticians that they had cataract He would limit the use of the term cataract to cases in which vision was reduced to about 6/18 He thought that there was an underlying factor in the general condition, and that many cases of so called primary cataract were in reality secondary to some general systemic defect, he was inclined to regard most cases as pathological rather than physiological He allowed patients to use their eyes, short of fatigue Professor JACKSON (Denver, U S A) objected to the term "incipient cataract" because it seemed to imply that the opacities would increase In his experience about half the patients over the age of 50 had lens opacities, of these only a small proportion progressed to the stage requiring operation, but a partial opacity frequently called for relief He mentioned the case of a woman, aged 65, who had a general haziness of the lens which rapidly reduced her vision She apparently was not drinking enough water, she was recommended to take more, and her visual condition decidedly improved after carrying out this simple measure The study of early cataract could be conducted better on private patients than in the mass in a clinic where many of them would not co-operate in the treatment prescribed Patients should have proper optical correction, and periods of rest from reading and other close work, they should be taught how to command and maintain the best condition of illumination Dr A J BALLANTYNE (Glasgow) agreed with Mr Ormond in limiting the use of the term "cataract," but he thought it might be extremely difficult to confine the term to any definite standard of lowered visual acuity In diabetic patients he had often seen the vision improve with general treatment, in spite of the apparent stationary condition of the lens opacities He then discussed the influence of toxic conditions He made it a rule to endeavour to improve the vision by optical correction, bad cases should not be considered unimprovable, for he had frequently been surprised at the relief obtained by the use of carefully prescribed glasses Dr ROBERT BEATTY (Detroit, U S A) related his experience as regards lens antigen He had made very careful tests in twenty-five selected cases, with examination of the visual functions and fields, and had prepared very accurate diagrams of the opacities, but he could not say that, except in a few cases of questionable improvement, he had obtained any very favourable results Mr A REID MOODIE (Dundee) dealt with certain aspects of the preliminary and other operations, and Dr FREDA RAMSAY (Beckenham) gave an account of her experience in India when attached to the hospital of Colonel Smith Mr BISHOP HARMAN (London) reviewed the various treatments, and agreed with Mr Cargill, Mr Ormond, and the other speakers as to the necessity of having a patient with cataract thoroughly overhauled He gave an interesting account of the examination of his first patient in Harley Street The patient was his own mother, and he was terrified to find lens striae in both eyes He had cautiously avoided making mention of them to her, and her vision had remained perfectly good for fifteen years That had been an excellent lesson to him in the way patients with lens striae should be handled Mr KELIX (Montreal) also took part in the discussion

Mr CARGILL, in his reply, referred to Professor Bell's and Mr Ormond's remarks regarding preliminary operation, while it was doubtless safe in their hands, he considered it unwise to teach students the trituration operation, and he considered it unnecessary to practise it himself He reviewed the remarks of the various speakers on the influence of sepsis, and mentioned a remarkable case of a private patient who, after developing a septic gall bladder, and undergoing the mental strain of her husband's death from cerebral tumour, had developed well marked cataract within a year, although she had not previously shown the slightest sign of lens opacity

---

SECTION OF DISEASES OF CHILDREN

Wednesday, August 27th

BACILLUS COLI INFECTIONS OF THE URINARY TRACT

THE President, Dr ROBERT HUTCHISON, took the chair and made a short opening address, in which he recalled the two previous meetings of the British Medical Association in Canada, at both of which he was present There had been no Section of Paediatrics then, as it was not then thought a sufficiently important subject Dr Hutchison reviewed the progress in diagnosis and treatment of disease in children, attending especially to the diminution of acute gastro-enteritis in England and the improvement in the prevention and treatment of rickets

Dr K D WILKINSON (Birmingham) opened a discussion on *Bacillus coli* infection of the urinary tract in children with the paper which appeared in full in our last issue

He said that it was a common condition, the frequency depending upon one's definition of the disease It was not easy to diagnose in young infants He classified cases clinically as (1) acute, (2) subacute, and (3) chronic, and described the symptoms and signs of these varieties He challenged the new conception of pyuria as an interstitial nephritis, as put forward recently by Dr Bruce Chown, and stated his opinion that the infection was not blood borne, but was an ascending infection up the urinary tract Dr D Navarro (London), whose introductory paper was published also last week, said there was little direct evidence that the infection was primarily one of the renal pelvis The *B coli* was a harmless saprophyte in the bowel, though even there it had been credited with a pathogenic role It had pathogenic properties in other organs He did not believe that cultural characters of organisms became fixed, but that they might vary with circumstance and environment Different strains of *B coli* had been found, some haemolytic others non haemolytic Urine should be repeatedly examined to see whether the same organism was present He emphasized the proportion of cases in which *B coli* pyuria was secondary to congenital or acquired abnormalities of the urinary tract It had been found that 2 5 per cent of all post-mortems on children showed some congenital abnormality of their urinary passages He showed pictures of specimens illustrating these abnormalities

Dr HELMHOLZ (Rochester, Minnesota) agreed with Chown, Wilson, and Schloss that post-mortems of these cases usually showed a lesion of the kidney, but was not convinced that such lesions were due to the *B coli* Experiments he had performed on animals showed that while the blood borne streptococcus and staphylococcus tended to localize particularly in the kidney, the *B coli* very rarely did so This fact was against the theory of blood infection in children It had been denied that any pelvic inflammation existed in post mortem cases, but he pointed out that the kidney pelvis was not easy to examine microscopically, numerous sections would be necessary to show its pathology, and in his opinion the pelvic lining was destroyed very rapidly after death He had found definite inflammation when the post-mortem was performed within two or three hours of death Pelvic inflammation was also found to heal very rapidly in experimental animals On the whole he was inclined to believe that the infection was only haematogenous in the newborn, but that after the first few weeks of life it was an ascending infection He did not, however, deny that kidney lesions might be present, even in the milder cases The disease was frequently associated with gastro-enteritis and was there commoner in girls than in boys He had pursued much the same lines of treatment as Dr Wilkinson Experiments had shown that if *B coli* were grown in alkaline broth and rapidly transferred to acid broth, they almost ceased to multiply, though the reverse was not the case He had had good results from treatment by urotropine (hexamine) in 0 5 gram doses, and generally used ammonium chloride and ammonium nitrate to acidify the urine up to a *p*H of 5 to 5 5 He thought that urotropine ought to be pushed to the point of bladder irritation, haematuria when it occurred came from the bladder If there was no improvement within three weeks he thought then all cases should be examined for congenital abnormalities

Dr BRUCE CHOWN (Winnipeg) dealt especially with the pyuria of infants under 2, as most of his work had been on these cases He did not think that there had ever been proof of a pure pyelitis occurring in infants nor was there often any post-mortem evidence of pyelitis even where the kidney was much diseased He had found a suppurative interstitial nephritis in most of his fatal cases, and others had reported the same At the earliest ages boys were affected only slightly less frequently than girls, though in older children girls were more commonly affected He believed the infection to be haematogenous in origin, though he admitted the possibility of a lower urinary tract infection occurring in some cases It must be borne in mind that the sex incidence and the route of infection were inseparable subjects, and that at present we were not in a position to state the exact sex incidence One point in favour of the presence of nephritis even in milder cases was the comparative frequency of pus casts in the urine Dr Chown pointed out the interesting fact that young calves who were too early deprived of the colostrum or their mothers' milk frequently developed a *B coli* infection of the kidneys This might have some practical bearing on the colostrum intake of young babies and the incidence of suppurative pyelonephritis

Dr R R STRUTHERS (Montreal) said that he had found pyuria very rare in male infants, and he had had no deaths from this cause In chronic cases he had investigated for congenital abnormalities and had often found that a cure could be brought about by surgical treatment Dr H C CAMERON (London) said that one must be careful not to jump to the conclusion that a case of pyuria with pus in the urine was necessarily a simple urinary infection This conclusion was often a complication of other infections, such as meningitis He pointed out also the difference between the clinical course and the bacterial course of the disease the former was often short while the latter persisted for a long time The PRESIDENT, taking a wide view, observed that more light might be thrown on the question if one could explain the incidence of the disease in adults, the question why *B coli* pyelitis should be so common in pregnant women, and why it should occur especially on the right side He suggested that a lateral infection should be considered as well as an ascending or descending infection Many cases had been associated with a diseased appendix He thought that an important part of the treatment was to raise the general standard of vitality Diet was also important, he believed that cases improved if the milk in the diet was cut down Dr WILKINSON replied and showed a radiogram of enlarged kidneys probably congenital cystic disease, in which there had been a secondary *B coli* infection

SECTION OF LARYNGOLOGY AND OTOLOGY

Thursday, August 28th

DIAGNOSIS OF LATERAL SINUS THROMBOSIS

THE PRESIDENT, SIR STCLAIR THOMSON opened the proceedings by expressing his pleasure at being in Canada again and at seeing so many of his old friends in the specialty He welcomed especially the visitors who had come from the United States Mr FRANCIS MUECKE (London) opened the discussion on the early diagnosis of infective lateral sinus thrombosis with a paper which is printed at page 465

In the subsequent discussion Dr JAMES T ROGERS (Montreal) said that the indifference of the public to the potential danger of a discharging ear, and the failure at times of the medical profession to recognize the aural source of the general epsis were two factors which seriously militated against an early diagnosis of lateral sinus thrombosis It was not surprising that many of these cases owing to the prominence of their general symptoms and the masked ear signs, found their way into medical wards where they were treated as pneumonia, typhoid fever, meningitis, influenza, malaria or gastro-enteritis In the early diagnosis of the condition the otologist was influenced by a marked euphoria of the patient, a high septic temperature chills and sweats oedema and tenderness over the emissary vein tenderness along the course of the internal jugular vein and the blood picture of high leucocytosis and positive blood culture Mr J F O'MALLEY (London) emphasized the importance of tenderness over the mastoid, a sudden rise in temperature, and rigor as pointing to systemic infection and indicating operation Other symptoms were less significant Dr AUSTIN A HAYDEN (Chicago) noted with some satisfaction that on the matter of blood culture there was some disagreement because he felt that this was a valuable point The leucocyte count was also often of considerable interest as was the haemoglobin estimation He laid most stress on chills and sweats, a history of ear discharge, the very characteristic temperature

curve, and the feeling of well-being experienced by the patient in the face of an obviously severe illness. Dr. A. LEISHMAN (Winnipeg) had operated on 703 mastoid cases in five years, among these were 18 cases of lateral sinus thrombosis with 11 recoveries. In most instances the symptoms appeared at about the fifth day, the first being a chill, though the patient felt particularly well between the rigors. He welcomed the insistence by Mr. Mucklo on operation before waiting for all the signs of sinus thrombosis to develop. Mr. A. J. M. WRIGHT (Bristol) asked what was the risk of exposing a lateral sinus, and also how far this method of diagnosing the condition was accurate. How often was infection present when the sinus was exposed? Mr. MUCKLO in reply said he felt sure that in many of the cases described a developing, one day later, the condition was actually present at the time of operation; others originated from a small spicule of bone penetrating the sinus wall or because an infected mastoid cell had been left. In reply to Mr. Wright he considered it better to explore the lateral sinus than to run any risk of overlooking an infected one.

CANCER OF THE LARYNX

With Professor H. S. BIRKETT (Montreal) in the chair, Mr. F. D. D. DAVIS (London) initiated a discussion on the diagnosis of cancer of the larynx (*Journal*, September 13th, p. 421). He said that extrinsic laryngeal cancer, or cancer of the pharynx which had extended to the larynx, usually came under observation so late that the diagnosis was obvious. The problem of diagnosis was intensified by the fact that cancer in itself produced no specific signs or symptoms. Intrinsic cancer of the larynx was seen at an earlier stage, since the early symptom of hoarseness sent the patient to the doctor much sooner, but cancer seen in its earliest stage was more difficult to diagnose accurately. If the nature of the condition was in any way doubtful, a diagnostic section was imperative and hastened the arrival at a correct conclusion. He had never seen any harm follow the removal of a diagnostic piece, but the picture might be entirely altered and the diagnosis be made more uncertain in the case of a negative section. In suitable cases time would settle the diagnosis, and judicious waiting, with an examination once a week, or at even longer intervals, would finally reveal the truth. If these methods failed in a case of suspected cancer, it was justifiable to perform an exploratory laryngo-fissure, having previously obtained full permission to proceed to a radical operation.

Sir STCLAIR THOMSON (President) said that earlier diagnosis of intrinsic cancer was not likely to eventuate until the public learned to consult the medical profession earlier for slight but persistent pharyngeal symptoms, and until the profession was more constantly on the watch for this disease in men of cancer age and in women of any age. In intrinsic cancer there should be no precipitancy in the attempt to establish a diagnosis. A few weeks of vocal rest (even silence), abstinence from tobacco, reduction of alcohol, and repeated examinations were valuable aids in confirming or eliminating suspicion, the interval afforded an opportunity for other complete investigations which, in addition to a blood examination, should include every reliable test for tuberculosis, it being remembered that a positive sputum finding was not invariably present in pulmonary or laryngeal lesions. Tuberculosis was more often mistaken for cancer than any other condition, the mistake was less frequent of diagnosing an epithelioma in the larynx as tuberculosis. All neoplasms removed from the larynx should be carefully examined under the microscope, and the larynx should be inspected once a fortnight for the three succeeding months. A malignant growth (whether indicated or not by the microscope), however completely removed, would show any recurrence within that time. If the biopsy reported the growth to be innocent, such a recurrence would almost certainly prove it to be malignant. True subglottic cancers were very difficult to diagnose in an early state, since the symptoms were absent or insignificant until the neoplasm had extended far enough to invade the edge of the vocal cord. It was in such cases, and in all doubtful cases, that an exploratory laryngo-fissure might be justifiable. When the diagnosis remained uncertain in spite of complete investigation, repeated observation, and rest to the larynx, a biopsy was indicated, but it did not always give a positive finding. It was most useful when the appearances suggested the presence of an innocent neoplasm or a tuberculous lesion. As Chevalier Jackson had said, "Every adult patient with hoarseness should be considered a possibly cancerous until proved otherwise", this was particularly important when, as Mr. F. D. D. Davis had insisted, the alternatives of pachydermia, tuberculosis, syphilis, and simple tumour had been excluded. If the diagnosis remained doubtful it might be well to advise a middle-aged or elderly subject to submit to treatment by the laryngoscopic route, sooner than risk the strain of uncertainty and the danger of delay. Dr. PETER GOLDSMITH (Toronto) congratulated the Section on the papers of Sir StClair Thomson and Mr. Davis. He reminded practitioners that old people could have cancer as well as middle-aged ones. Laryngectomy, he considered, should not be performed until the patient fully realized what that operation meant. Mr. J. J. O'MALLEY (London) was influenced by Sir StClair Thomson's insistence on the importance of relying on clinical symptoms in the diagnosis of cancer of the larynx, rather than on information supplied by the laboratory. Dr. CLAIG (Montreal), referring to the treatment of cancer of the larynx, said that his personal results had greatly improved since employing electrocoagulation and radium. Mr. F. D. D. DAVIS, in reply, emphasized the difficulty of reaching an early diagnosis in the case of a subglottic growth.

SECTION OF ORTHOPAEDICS

FRACTURES INVOLVING THE KNEE-JOINT

Mr. F. JAMING EVANS (President) took the chair. The opening of the discussion took the form of a symposium, fractures of the weight-bearing areas being dealt with by Mr. R. OLLERENSHAW (Manchester), whose paper is published at page 466, epiphyseal injuries by Mr. W. A. Cochrane (Edinburgh), and injuries of the extensor apparatus by Mr. R. Watson Jones (Liverpool). A short paper by Dr. Gallie (Toronto) on injuries to the ligaments and tendons of the knee was incorporated in the discussion. In the absence of Mr. Ollerenshaw his paper was read by the local secretary.

Mr. W. A. COCHRANE (Edinburgh) said that the important point in the treatment of forward displacement of the lower femoral epiphysis was to keep the knee fully flexed for at least two weeks, in order to prevent redisplacement. In neglected cases, exposure by a free anterior and posterior incision was preferable to a single incision, because by this exposure shock was reduced, the danger to the vessels was less, and reduction was easier. In old cases united with deformity, good results were secured by supracondylar osteotomy. Fourteen personal cases of anterior displacement of the lower femoral epiphysis were reviewed. Mr. WATSON JONES (Liverpool) remarked that in all injuries of the extensor apparatus, including avulsion of the quadriceps, fracture of the patella, avulsion or rupture of the ligamentum patellae, and separation of the tibial tubercle, the problem of treatment was to restore extensor power without in any way impairing flexion movement. In fracture of the patella this necessitated sufficiently firm operative fixation to render splintage unnecessary and to allow early movement. Cases were shown of fixation by double sutures of silk where full movement had been retained throughout. The difficulty of repairing avulsion of the ligamentum patellae from the patella was pointed out, and an operation was described by which the patella was anchored to the tibia by a strip of the iliotibial band. Cases illustrating the so-called "myositis ossificans of the quadriceps" were shown, it was pointed out that the condition was due to avulsion of the quadriceps from the patella, and was to be avoided by suturing the muscle to the bone before instituting movement. Separation of the epiphysis of the tibial tubercle demanded operative treatment, unless the injury occurred after fusion of this epiphysis with the

upper epiphysis of the tibia in such a case displacement was limited and could be controlled by simple strapping and a back splint Dr CALLIE (Toronto) stated that when tendons or ligaments were ruptured the end retracted and spontaneous union always resulted in a wide weak scar Immediate operative treatment was therefore advised in all cases, and this should take the form of repair by living fascial sutures or of replacement by living tendons cut from the *Achilles* or *semitendinosus tendons* Various types of operation were described including a new procedure for replacement of the posterior crucial and internal lateral ligaments The technique of this operation was very simple, the procedure was safe and although results were not perfect they were as good as the results of Hey Groves's operation For repair of avulsion of the quadriceps and ligamentum patellae the speaker preferred to use free fascia lata drawn through the muscle or ligament and passed through a drill hole in the bone A new technique was described for anchoring the patella to the inner femoral condyle in lateral dislocation Dr CRONGE (Winnipeg) described the treatment and results in a comminuted fracture of the upper end of the tibia which he had personally sustained some years previously Dr GALLOWAY (Winnipeg) said that in comminuted fractures of the upper end of the tibia it was impossible to restore accurately the original anatomical conditions Since osteo-arthritis was liable to supervene in later years he advised immediate excision of the joint in many cases He asked if Mr Watson Jones took any special precautions in the sterilization of the silk used, because in his experience it was *frequently necessary to remove it later* Mr CHITTY (Bristol) advised three months' immobilization in plaster for the repair of rupture of the crucial ligaments this treatment gave perfect results with no disability Her *Groves's operation was unsatisfactory* because, although the results were good at first, the tendon subsequently stretched, and instability of the joint recurred Mr E LAMING EVANS (London) showed a case of forward displacement of the lower femoral epiphysis in which displacement had recurred despite operative reduction it had been necessary to operate again and to use a Steinman pin through the epiphysis and diaphysis The pin was removed after three weeks Mr COCHRANE, replying said that although he had never used a pin through the lower femoral epiphysis to augment fixation he had seen one such case in which the end-result was unsatisfactory owing to infection Mr WATSON JONES replied that the silk was boiled for fifteen to thirty minutes and was then stored in spirit The essential point was that the silk was under no circumstances touched by hand Silk had been used in over fifty cases, and only once had it been removed

SCIATICA

Dr NUTTER (Montreal), in a short paper on sciatica maintained that true sciatic neuritis was due to mechanical *pressure on the fifth lumbar root* usually exerted on the nerve as it lay in the intervertebral foramen between the disc and the intervertebral joint All the symptoms and signs met with in sciatica were attributable to irritation of the fifth root alone, and the speaker did not consider that sacro-iliac disease, lumbo-sacral arthritis and sacralization of the fifth lumbar transverse process were important etiological factors The most valuable therapeutic agent was heat in any form Diathermy for long periods—averaging forty-five minutes—was the routine treatment and immobilization by a plaster spica or leather supports was only occasionally employed Manipulation was sometimes useful to liberate adhesions of the nerve in the intervertebral foramen

CLINICAL CASES

At a clinical session in the afternoon Dr H P H GALLOWAY (Winnipeg) showed cases of congenital dislocation of the hip reduced by operation including cases five and eight years after conclusion of treatment The patients had full movements and good stability with no limp Dr A GIBSON (Winnipeg) demonstrated cases illustrating a new operation for fusing the spine by a special H shaped graft from the tibia A case in which arthrodesis of the shoulder had been performed ten years previously showed marked failure of development of the clavicle owing to functional disuse Although the patient was still prepared to perform the operation in both the right it was *contraindicated* in girls Cases of tendon transplantation for thenar palsy and for abductor palsy of the hip were also exhibited A case of partial fusion of the lower tibial epiphysis with resulting talipes varus owing to *unbalanced growth of the fibula* provoked considerable discussion Dr GARDNER (Winnipeg) asked whether it would be feasible to excise the lower epiphyseal line of the fibula in order to balance growth Dr GALLOWAY (Winnipeg) said that he had seen a case where the lower epiphyseal lines of both tibia and fibula had been excised with a good result although there was considerable shortening Dr GIBSON (Winnipeg) preferred to perform osteotomy of both bones above the epiphyses Since the girl was now 15 years old he did not anticipate further growth, and thought that an operation was now due Mr WATSON JONES (Liverpool) said that McFarland of Liverpool had reported several such cases he thought that the condition was due to compression of part of the lower epiphysis of the tibia by the upper and inner angle of the astragalus More than one osteotomy was necessary as the child grew older and it was advisable to overcorrect the deformity by taking a piece from the fibula, and forcing it into the linear osteotomy of the tibia, so converting it *into a cuneiform osteotomy base inwards* Cases were also demonstrated by Dr W A GARDNER (Winnipeg) Dr A P MACKINNON (Winnipeg), and Dr A A MURRAY (Winnipeg)

SECTION OF RADIOLOGY

Thursday, August 28th

BENIGN TUMOURS OF THE STOMACH

THE President of the Section, Dr A E BARCLAY, having thanked the medical men of Winnipeg for their kind hospitality called on Dr W H DICKSON (Toronto) to open the discussion on benign gastric tumours Dr Dickson dealt first with diffuse gastric polyposis its incidence, age period of onset, and radiological diagnosis He then passed in review the radiological diagnosis of a second group of tumours, which included single polyps, myomas, fibromas, neurofibromas, angiomas, and lipomas The third group consisted of syphilitic gastric tumours, and the *lecturer gave some account of the radiological method of* demonstrating these lesions His conclusions were (1) while benign tumours of the stomach did not occur nearly as frequently as the malignant type they were not as rare as was formerly supposed (2) a correct diagnosis would be of inestimable value to the surgeon, (3) if correct diagnosis was not obtained malignant degeneration of the benign tumour might result (4) syphilitic tumours of the stomach occurred with greater frequency than previous teaching had led us to believe More accurate information on the pathology of these cases would be obtained from the *x-ray* room and the operating theatre than from the healed condition occasionally found at necropsy

Dr BERNARD MOONEY (Edmonton), who followed said that he had looked up the records of the four general hospitals in Edmonton, and, having excluded inflammatory masses of a syphilitic character, those due to ulcer and linitis plastica, he was surprised to find that not a single case of benign gastric neoplasm was available *The rarity of these conditions was also borne out by the published* statistics of Charles Higgins and James Douglas In the only case in his experience the *x-ray* investigation showed the duodenal bulb deformed but not the characteristic appearance of a duodenal ulcer The interpretation of this finding was thought to be a benign pedunculated tumour about the size of a plum An exploratory operation was performed and a *small tumour* about three-quarters of an inch in diameter was found on the duodenal bulb, with a small pedicle extending through the pyloric sphincter which was attached to the lesser curvature of the stomach about one inch from the pyloric ring The pathological report was "simple fibroma" He concluded by congratulating Dr Dickson on the large volume of this

type of work he had presented The President thanked Dr Dickson for his paper, which he described as a classic

X Rays in Medico Legal Cases

Dr MALCOLM DONALDSON (London) then took the chair and called upon Dr A HOWARD PIRIE (Montreal) to read his paper on x-ray diagnosis in medico legal cases Dr Pirie opened his paper by quoting from the *British Medical Journal* of June 8th, 1901 (p 1390), in which Mr Golding Bird pointed out the need for having an expert to make the radiogram, and also an expert to interpret it The radiologist had as much right to know the history of the case as the physician, he had to know all about unusual epiphyses, and to be able to recognize the rare bones of the foot and wrist when these existed He stressed the importance of making more than one view in every case of suspected fracture, as some might only be visible at certain angles In some injuries of the limbs he advised that a radiogram of the corresponding region of the opposite side be taken as a routine A negative x ray might have considerable value Dr Pirie then showed a table completed by P V Davis showing the average number of days of disability following various fractures It was interesting to note that 208 days was the average disability following a fractured femur and forty eight days following a Colles fracture Dr J F SMITH (Saskatoon) stressed the importance of securing plates immediately in all accident cases A mild trauma was sometimes sufficient to activate a quiescent pathological condition such as chronic osteo arthritis, in this way employers of labour were frequently held responsible for conditions alleged to have been caused by serious injury, when in reality the disability was pre existent in a dormant state The accurate interpretation of these changes was the field of the radiologist, who should be able to say whether they were acute and due to the alleged trauma, or chronic and due to pre-existing disease Dr W H DICKSON (Toronto) called attention to certain cases of injury to the carpal bones, in which immediately after injury there was no change or fracture, but two or three months later there were signs of collapse and degeneration Dr FRANK A SMITH (Winnipeg) laid stress on the importance of correct interpretation of x ray films, and said this could only be done by a medical man skilled in radiology

The Mechanism of Swallowing

The discussion which followed was opened by the President, Dr A E BARCLAY (Cambridge) The members of the Section of Otology and Laryngology had been invited to take part in this discussion, during which Sir STCLAIR THOMSON (London) took the chair Dr BARCLAY said the act of swallowing was very complicated It was definitely established that there was invariably a moment during which the pharyngeal space was obliterated prior to opening up to allow food to pass down As the mouth, nasopharynx, and larynx were closed at this moment, it was strongly suggestive that a negative pressure must be produced, and that this was the dominant factor in the act of swallowing Further, it was suggested from the rate at which the food passed, and also from the shape of the bolus, that this negative pressure extended some distance down the oesophagus The larynx was shut off from the pharynx during swallowing by the drawing up of the laryngeal pharynx behind the laryngeal opening till it was in contact with the posterior surface of the epiglottis In this epiglottic position, the laryngeal pharynx appeared to be an open-mouthed receptacle ready to accept the food as it came off the back of the tongue Dr Barclay described how this study had been carried out by x-ray observation, and mentioned that arrangements had been made to complete the investigation by research into the anatomical conditions that made this mechanism possible

Dr L J CARTER (Brandon), who followed, pointed out the difficulties of such an investigation owing to the exceeding rapidity of the first phase of the act of swallowing He awaited eagerly the confirmation of Dr Barclay's first statement that the first portion of the act of swallowing was due to a kind of vacuum in the laryngeal pharynx immediately preceding the reception of the food bolus Dr Barclay's work was an illustration of the progress radiology was making through the use of new instruments This research had been made possible by the use of serial radiography, and by the adoption of the methods of the experimental physiologist Radiology to-day was passing through a change similar to that which came to cardiology fifty years ago It began with the fluoroscope and the radiograph, to day we were using the moving picture and the method of the experimental physiologist Mr JOHN F O'MALLEY (London) said he was of the opinion that the pharynx was a muscular sac held open by the hyoid, and that the tongue pushed food into it by a piston like action He had some doubt about the epiglottis folding over as was usually taught He had pointed out some four years ago that in the human foetus at five months the epiglottis was in the nasopharynx, which was the position in the adult The whale and alligator and such animals had no difficulty in swallowing without any falling over of the epiglottis Mr I D D DAVIS (London) pointed out that the epiglottis was a vestigial structure which directed the air into the nasopharynx and nose, and became modified for the production of speech The larynx was pulled up against the cushion of the epiglottis and the base of the tongue during swallowing In his opinion the epiglottis did not fall over the orifice of the larynx Removal of the leaf of the epiglottis did not affect swallowing in any way He considered the act of swallowing demanded a combination of air pressure and muscular action, as shown by the inability to swallow in paralysis of the muscles of the pharynx Dr AUSTIN HAYDEN (Chicago) thought a cinematograph of the act of swallowing would be very instructive Intra oesophageal and intragastric photography should soon become an illuminating factor in the study of diseases as well as of the function of these organs He said it was an interesting fact that the sword swallowers passed the sword through an absolutely immobile throat and oesophagus, and the ventriloquist could drink and sing simultaneously

SECTION OF MEDICAL SOCIOLOGY AND HISTORY OF MEDICINE

Wednesday, August 27th

Migration Within the Empire

THE President, Dr JOHN D COMRIE, took the chair, and briefly conveyed greetings from British medical schools, and from Edinburgh in particular to Canada he made mention of the influence of Scotland on the development of Canadian medical schools Dr T C ROUTLEY then opened the discussion on the first subject of the programme—namely, migration within the Empire Dr Routley emphasized the importance of the medical profession taking an interest in this subject, which required analysis, the main object was to establish and maintain a balance of population A graph was shown giving evidence of the disturbed balance in the United States, and the speaker insisted on the necessity for securing a larger proportion of British stock to maintain the balance The type wanted was the pioneer type, and the wisdom of the dole system was questioned as leading to deterioration of this The treatment of the problem was a matter of supply and demand, but it must be intelligent The formation of a national board was suggested to deal with population, and to study and make recommendations, an Imperial Board might be worth creating to take the matter in hand and gradually evolve an imperial scheme Sir JAMES BARRETT combined his own remarks on the Australian problems with comment on Dr J S PURDY's paper, which, in the author's absence, was taken as read The hope of world progress lay in the proper development of the British Empire He explained the New Dublin League, and pointed out that migration was no solution of over-population, but only of the distribution thereof, conducted through the agency of churches it worked well He gave an interesting account of the assimilation of the Maoris Sir James then expressed strong views on the standards

adopted for migrants. He suggested that all that was necessary was a certificate from an approved board of examiners that the person was in such physical condition as not likely to become a burden on the country which he entered. A resolution to this effect was later adopted by the Section. He was also strongly of the opinion that no governmental responsibility should be taken for a migrant after his arrival. He pointed out that tropical Australia could be populated by whites because there were no fatal indigenous diseases, there being no native population.

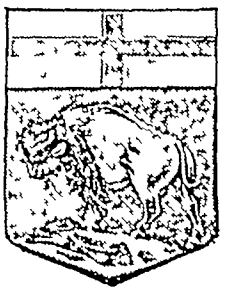
Dr H M. SPEECHLY then opened a discussion on juvenile immigration to Canada, giving what he called a clinical example—an account of the work of the Church Army and its hostel. Boys came from families, and had good references, but the medical examination was weak. The hostel was responsible for a boy for three years, or until the age of 20. They were placed with responsible farmers, and visited frequently. The importance of correct clothing was realized, and it was provided. Saving money was encouraged. A very interesting series of lantern slides was shown to illustrate stages of these lads' careers.

The PRESIDENT then declared the subject open for discussion. Dr J. H. HARVEY PIRIE of Johannesburg said that their problem in South Africa was that of the whites holding their own against the blacks. Quarrels among whites would settle themselves. Migration was outwards rather than inwards. White immigrants required to be possessed of enough capital for three to five years. No white races could establish themselves in tropical South Africa, but Dr. Pirie was prepared to believe the statement of Sir James Barrett that the existence of natives with indigenous diseases was responsible for this. The "poor white" question was largely a matter of diet. The present one of "mealies," being quite unsuitable. Dr. WARDELL (Moose Jaw) asked for a fuller discussion of economics, and thought it an unfriendly act on the part of Britain to buy Argentine wheat. He also pointed out the local difficulties of doctors in outlying districts. Professor J. W. CRANE (London, Ontario) gave an amusing account of the confusion with London, England, and reminded the Section that there was a Piccadilly and St. Paul's on this side. He thought Canada was losing graduates to America and made a point of advising his travelling students not to choose the American nurses for wives but to come back for Canadian ladies. Moreover, he always tried to get his graduates a post in Canada and to ensure that they were helped. Dr SPEECHLY, replying, thought 14 to 16 was the ideal age for immigration and agreed with the dangers of unregulated immigration.

After the other openers had very briefly replied the PRESIDENT put to the meeting two resolutions—one favouring the establishment of an Imperial Board of Immigration and the other the acceptance of a general certificate of fitness. Both resolutions were adopted and referred to the secretaries for formulation and report to the Council of the Association.

Thursday, August 28th

FACTORS INFLUENCING HEALTH IN CANADA



Dr JOHN D. CORRIE (President) again took the chair, and called on Dr J. J. HEAGERTY (Ottawa) who said that the original title of his paper had been "Factors influencing the development of medicine in Canada", he would try to correlate the two conceptions. In the course of a brief journey through the past, describing the passage of the St. Lawrence as an effort to reach Cathay and mentioning the first medical treatment of the Indian chief Agontawa by the "laying on of hands" by Cartier for paralysis, the speaker reached the onset of scurvy among the Indians. This disease spread to the whites and in an effort to discover the cause the first necropsy in Canada had been performed in 1534. Cartier was made an Indian chief for the same reason as in the case of Lord Dawson on August 27th 1930—namely that he was a great healer. McGill University was built on the site of the first medical treatment in Canada. The Indian remedy for scurvy was found in a decoction of the bark and sap of the spruce tree, which quickly relieved the symptoms but the disease continued as a scourge to succeeding expeditions and small pox came as an additional disaster. This last infliction with alcohol and war, had almost exterminated the Indian. Interesting accounts of small pox epidemics and their effect in antagonizing the Indians, or the way we dread known as the "Jesuit Relations", or the reports, of the disease and the introduction of vaccination in 1897 were given, also of the establishment of the Hôtel Dieu in Quebec in 1639 by the Duchesse d'Aiguillon, niece of Cardinal Richelieu. The history and trials of this harbour were outlined. Its first surgeons had been barber-surgeons," with no need for degrees or apprentice hip. Mention was made of Duchesne and Sarrazin of the influence of the early physicians on the community. The founding of hospitals was then described leading up to the present state of licensing and reciprocity and the development of public health. In conclusion, the speaker foreshadowed special licensing requirements for specialization. Dr SPEECHLY (Winnipeg) explained the confusion as regard titles mentioned by Dr Heagerty. Sir JAMES BARRETT remarked that military campaigns were affected by diseases more than was commonly realized. The first campaign conducted on the basis of health was that of Allenby in Palestine where action was often only possible in the interval between infection by and incapacity from malaria. He referred to Cleopatra's warning to Antony not to attack Persia because armies sent there did not return. He also commented on the fact that Cook went round the world free of scurvy but his crews perished from malaria after reaching Batavia. The freeing of Jerusalem from malaria, the inscription of the Desert Mounted Corps on the Conqueror's Stone at Dog River and the advisability of writing up campaigns from the medical point of view, were also noted. Professor CRANE (London, Ontario) mentioned Dr Heagerty's book *Four Centuries of Medicine in Canada* and the discovery in the Ottawa archives of a book presented by Jenner to the Five Nations. He pointed out that the white had given to the world syphilis and civilization and suggested disease changed history. Dr T. C. POTTER (Toronto) mentioned the lack of knowledge in England of Canadian conditions though almost all the discoveries in Canada came from the Mother Country. Sir JAMES BARRETT poke of the cairns erected along the route of discoveries in Australia, seven out of eight bore the names of people from the Old Country. Dr MACKINTOSH asked about the origin and spread of tuberculosis and Dr HEAGERTY replied that no signs had been found in old bones to reveal how tuberculosis and all European diseases were common.

Dr D. A. STEWART (Nanette) read a most interesting paper on the life of Sir John Richardson surgeon explorer of the Arctic and also sailor naturalist and scholar. His early life and "wisdom in the choice of his parents," with his many and wide enthusiasms, were pointed out. At the age of 19 when an assistant surgeon in the Navy he had seen service against the French and Americans and then became interested in exploring for the North-West Passage. he had joined the Franklin expedition in 1824. He became chief medical officer to the Royal Hospital at Haslar and was one of the first to free insane people from the barbarous treatment then in vogue by proving to the Admiralty that his methods were less costly. He took part in the search for Franklin and was knighted by Queen Victoria. He personally knew Florence Nightingale, Thomas Carlyle, and Burns. Dr HEAGERTY congratulated Dr Stewart on his paper describing it as replete with food for thought and interest. Sir JAMES BARRETT, remarking on the smallness of the world mentioned that Franklin as a midshipman had limbed a hill at Melbourne and again as Governor of Van Diemen's Land before leaving ultimately to disappear in the Arctic. Sir James also proposed that in the best interest of medical education the Section should recommend that the history of medicine ought to be a subject for all higher degrees or qualifications. This was carried unanimously. Dr GORDON BAKER thanked the readers of papers he expressed the view that study of this subject would tend to prevent a tendency to sectionalism, which he thought was becoming apparent.

British Medical Journal.

SATURDAY, SEPTEMBER 20TH, 1930

THE WINNIPEG MEETING

THE Annual Meeting of 1930 will be memorable for many reasons It is one of the three occasions on which the Association has met outside what is still medically the United Kingdom, and it is the third Annual Meeting held in the Dominion of Canada The warmth of the welcome given to the Association can hardly be overstated, and the event has been everywhere regarded as one of high moment The evidence supporting these propositions was by no means confined to the medical profession On the contrary, it has been abundantly supplied by the most distinguished representatives of the Federal and Provincial Governments, and by the municipalities and citizens in all places visited by the Association The visit to Canada has indeed been interpreted as possessing a note and quality of patriotism, and has been welcomed as an expression of cordiality and good feeling between peoples who share a common tradition and a common loyalty, and look with confidence also to a common future It may be accepted as certain that, other values apart, the British Medical Association is widely credited with large and worthy motives in its decision to travel to Winnipeg for its Annual Meeting Another certain conclusion is that the habit of reciprocity will be encouraged The centenary meeting of 1932 will, in any event, attract many individual visitors from the Dominions, and it may be well to consider without delay the possibility of some comprehensive official invitations British hospitality has received a fair challenge and must use its opportunity in no grudging fashion Even further, the experience of 1930 must be added to other events which emphasize the importance of multiplying personal contacts between members of the Association in the various parts of the Empire Manifestly the Association can only on rare occasions cross the seas for its annual meeting, but official delegations will be more and more earnestly desired in the Dominions, and both for these and for the reception of delegates in the home country adequate provision must certainly be made If Winnipeg has not exactly set the ball rolling she has certainly contributed an added impetus

We have already begun publication of reports of the technical or strictly professional activities of the Annual Meeting, here it is sufficient to say that many important communications were made in the various Scientific Sections, that the attendance of members was rather above than below the average, and that the reports printed in the local press were creditably accurate as well as full The proceedings were clearly recognized to be of great public interest Naturally this was particularly true of the larger and semi-public functions At the adjourned general meeting a telegram of welcome and good will from Lord Willingdon, the Governor General of Canada, was read, and a suitable reply from the President was warmly endorsed by the audience Cordial and inspiring speeches were delivered from the platform by the Hon John Bracken, Prime Minister of Manitoba, and by Lieut.-Colonel Ralph H Webb, the Mayor of Winnipeg, who presented a flag of the city to be placed in the Great Hall of the Association The new President in his address commanded the attention of a large audience, and he was received with much enthusiasm Interesting features included in the ceremony were the investiture of new officers with their appropriate badges, the introduction of foreign delegates and of delegates from the Dominions and Colonies, and of Dr Alex D Blackadder of Montreal and Sir Ewen Maclean as Vice-Presidents, while the reception given to the Most Rev Samuel Pritchard Matheson, D D , Archbishop of Rupert's Land and Primate of All Canada, and to Mr Thomas Bassett Macaulay, LL D , showed a cordial local approval of the action of the Association in adding these names to the list of its Honorary Members Besides the official representatives already mentioned the platform party included the Hon J D McGregor, Lieutenant Governor of Manitoba, the Hon Dr Egbert, Lieutenant-Governor of Alberta, and the Hon E W Montgomery, Emeritus Professor of Medicine and Minister of Health and Public Welfare for Manitoba

A feature of special distinction in the programme was the religious service, and no one who took part in this is likely to forget it Processions of the British and Canadian doctors and of visitors were organized at headquarters and marched through crowded streets to the picturesque square in front of the stately Legislative Building of Manitoba Having passed to their places members saw in front of them effectively arranged groups of naval cadets, boy scouts, hospital nurses, ex-service nurses, and immigrants from Iceland and other countries in their picturesque national dresses, the whole, including members in their academic robes, forming an attractive and inspiring scene The setting was most artistic and the stage management admirable It is noteworthy that the "committee" to whom the organization of this function was committed consisted of one man, Dr H M Speechly, who proved himself more than equal to the occasion and received thanks and congratulations from all quarters The service was conducted by Archbishop Matheson, the Lesson was read by the President of the Association, and the music was rendered by the band of Princess Patricia's regiment under the direction of Captain I W James On the way to the religious service the procession halted while the President, on behalf of the Association, placed a wreath at the base of the Cenotaph, and everyone stood to attention while a bugler sounded the "Last Post" Winnipeg may claim an Annual Meeting with many features having an individual quality, and high among these must be placed the outdoor religious service held in picturesque surroundings and organized with delicate and artistic skill Effective management was shown also in many other directions, and particularly in the arrangements for the official dinner, where some 1,600 persons found their places without difficulty and enjoyed the benefit of a prompt and admirable service, it was a triumph of organization The company enjoyed a brilliant speech from Lord Moynihan, who proposed "The Empire," and a happy and characteristic contribution from Sir StClair Thomson, who submitted the toast of "The Guests," while Mrs Harvey Smith gaily responded for "The Ladies," proposed by the Past President, Professor Burgess, an effective acknowledgement of the toast of "The Association" was made by Dr Brackenbury

Winnipeg has yet to build its worthy university ceremonial hall, but as it has made an attractive and flourishing city out of the prairie in the course of fifty to sixty years there can be no doubt of its capacity for academic and other developments. In the meantime the convocation for the conferring of honorary degrees was held in the Winter Club and was a very impressive ceremony. A special welcome was given to Dr. T. Wilbs Prowse, Dean of the Faculty of Medicine in the University of Manitoba, in recognition of his successful efforts to raise to a university level the teaching in the medical school. Lord Dawson of Penn acknowledged, on behalf of the new honorary graduates, the courtesy of the university, and spoke of the common interests of the home country and of Canada. On the first evening of the meeting was the Listerian Oration, which delivered by Lord Moynihan drew a crowded audience, and will certainly take a worthy place in the numerous tributes paid to the fame of the great English surgeon. The chair was appropriately taken by Dr. John Stewart, Emeritus Professor of Surgery, Halifax, Nova Scotia, who was at one time house surgeon to Lister, and was himself the Orator when the Canadian Medical Association met at Ottawa in 1924. Not the least pleasing of the various ceremonies was the gift to the British Medical Association of a buffalo head as a souvenir of the Winnipeg Meeting, and added significance will be found in the fact that the presentation was made by the Hon. R. B. Bennett, K.C., Premier of Canada. Of many other ceremonies, including the one that made Lord Dawson into an Indian chief, we can only say that they were admirably planned and were carried out with genial and hearty good will. Hospitality, both official and personal, reached its farthest possible bounds, and was given not only generously but gladly; guests found hosts who were obviously pleased to offer a full welcome. The President and Mrs. Harvey Smith and their numerous colleagues, lay and medical, are to be congratulated on a great success; they have contributed a special and distinctive record in the history of the British Medical Association.

THE MENTAL TREATMENT ACT 1930

In the realm of psychological medicine the outstanding event of the past twelve months was the introduction by the Government in November 1929 of the Mental Treatment Bill which received the Royal Assent and became an Act of Parliament on July 10th, 1930. It is natural therefore that the Commissioners of the Board of Control should have chosen to devote the introductory section of their latest annual report[1] to an explanation and appreciation of the provisions of this Act. The Commissioners believe that this measure will come to be regarded as a great landmark in the history of legislation dealing with the treatment of mental disorder. The new Act for the first time authorizes the reception of voluntary patients into public mental hospitals. It is earnestly hoped that local authorities will realize that from the point of view of both humanity and economy treatment cannot begin too early, and that they will therefore see that any charge made for the reception of voluntary patients shall not be such as to discourage admissions in the incipient stages of the disease.

An even more important feature of the new Act is the provision for temporary treatment of non-volitional patients, on the recommendation of two medical practitioners and without the intervention of any judicial authority. In the Board's opinion this is an epoch making change, but it will fail of its full effect unless local authorities rise to the measure of their new opportunities. It is of the utmost importance that the non-volitional patients whose prospects of early recovery may be favourable, should have a chance of escaping the supposed stigma of certification. But the change will become a mere alteration of label, a mere detail of nomenclature, if patients, under the new procedure, are to be warded indiscriminately with certified chronic cases. The new provision is based on an implicit understanding that local authorities will provide, as many have already done, a separate admission hospital equipped with modern therapeutic resources and supplemented by adequate convalescent villas.

The Board of Control welcomes also the provision whereby it has power to approve institutions and hospitals other than mental hospitals for the reception of voluntary and non-volitional patients. There are many smaller general hospitals which do not possess either the staff or the equipment desirable for the treatment of any form of mental disorder, and in any case the Board does not expect that voluntary hospitals will, in general, be prepared to receive into their ordinary wards patients who might be disturbing to others. But there are many cases which could with advantage, be treated in teaching hospitals and in those non-teaching hospitals which are large enough to have wards for nervous and mental disorders. In the case of the teaching hospitals such an arrangement would be of special value not only from the point of view of the patient but in the interests of medical and nursing education. At present the amount of teaching which the undergraduate student receives in psychiatry is lamentably inadequate, though it cannot be appreciably increased without adding to a curriculum recognized as already overloaded. But the admission of suitable cases to neurological and mental wards of teaching hospitals would, in the Board's opinion, provide favourable opportunities of experience to the student without any addition to the present curriculum. The Board however points out that if developments on these lines are to be successful the staff of the mental hospital should be associated with any treatment given at the voluntary hospital. Association between the two will be beneficial to both; for the advancement of medical knowledge is only hampered by the treatment of mental and physical diseases in watertight compartments instead of in relation to one another.

Another change of great importance to which the Commissioners' report draws attention is the statutory recognition of the out patient clinic for patients suffering from mental illness. Authorities are now empowered to provide such a clinic and arrange for its provision with the voluntary hospital of the area. There are obvious advantages in conducting an out patient clinic as a part of a voluntary hospital. Patients in the earliest stages of mental instability will more readily resort to a centre which is not dominated in their minds with mental disorder, while other patients who are in need of treatment by a psychiatrist though they themselves do not realize their need will come under the notice of the medical staff in the ordinary course of their work. It is essential to the success of voluntary treatment in the early and hopeful stage to secure the patient's confidence and co-operation, and the Board does not believe that

THE MEDICAL REGISTER UNTRACEABLE PRACTITIONERS

WE publish in the *Supplement* this week (p 141), at the request of the Registrar of the General Medical Council, a list of the names of those medical practitioners who have not replied to his inquiries as to the accuracy of their postal addresses Any practitioner whose name is included in this list should communicate at once with the Registrar of the General Medical Council, 44, Hallam Street, Portland Place, London, W 1, or, in certain specified cases, with the Registrar of the Scottish Branch Council, 12, Queen Street, Edinburgh

---

THE next meeting of the International Association of Surgery will be held in Spain in 1932, when the following subjects will be discussed treatment of intraspinal tumours, non-tuberculous pulmonary suppuration, and *surgery of the oesophagus*

ARSENIC IN SWEETS.

A REPORT ON THE STOKE CASES

THE following note on the recent outbreak of poisoning in sweets contaminated by arsenious oxide has been contributed by Dr A Wotherspoon, medical officer of health for the city of Stoke-on-Trent

On September 2nd, 1930, notice was received at the Health Department from Dr Glass, a general practitioner in the Norton district of Stoke-on-Trent, that some twelve children in his practice had been taken ill after eating certain sweets Inquiries were at once set on foot, and it was discovered that all the sweets had been purchased at a shop in the neighbourhood The particular sweets were cough-drops, and had caused twelve children to be ill shortly after eating them The symptoms in every case were the same, and came on from one to two hours after eating one or more of the sweets Everything pointed to some irritation of the stomach, followed by vomiting, which, in the mildest cases, lasted from six to seven hours

The suspected sweets were sent off the same day for analysis, and a wire was received the following day stating that large quantities of arsenic had been found in them Just previous to receiving the wire from the analyst the medical officer for the Congleton Urban District telephoned to say that he had had similar cases of poisoning in his district due to consuming cough-drops, and after submitting samples to the Ministry of Health had heard that they contained arsenic

The premises of the wholesaler were visited, and it was found that the sweets had been manufactured by a Stoke-on-Trent firm The factory, which was a small one, was next visited, and the proprietor was questioned as to the ingredients of the cough-drops These were given as follows White sugar, brown sugar, glucose Flavouring consisted of paregoric, oil of peppermint, oil of cloves, horehound essence, eucalyptus oil, and oil of aniseed The proprietor, in the course of conversation, said that the cough-drops manufactured on August 27th had not been made by him but by another sweet-boiler, as he himself had been ill He also said that this same man had brought a bag of dusting powder to the works a week previously, which he had purchased

Samples of all the ingredients were taken, including the white powder brought by the man who made the boiling of the cough-drops and some other sweets on the 27th This man in interview, gave the same ingredients already mentioned by the proprietor as those he had put in the cough drops The following morning, September 5th, the works were again visited by myself and Dr Monier-Williams from the Ministry of Health, and further samples of everything likely to contain arsenic were taken Up to this date no cases of illness had been reported or suspected from any other type of sweets from the factory, but on September 6th some cases were heard of from other sweets —namely, mint rock—and the whole of the sweets made at *the works* after August 27th—the date on which the poisoned boiling was made—were seized

On September 8th a wire was received from the Ministry of Health to say that the dusting powder sold to the works on August 18th was pure arsenious oxide This being the case, all sweets made after August 18th, the date the powder was taken to the works, were then recalled, and the works sealed up until such time as an analysis of all the substances in use there had been made and pronounced free from arsenic

The extraordinary thing about the whole case is the fact that there have been no deaths, possibly because the large quantities of arsenic caused vomiting, and so were expelled from the system before further absorption had taken place The quantities of arsenic varied in the several analyses carried out from 77 to 150 grains in every pound of sweets Some of the sweets contained as much as two-thirds of a grain in each one, and there were about five sweets to an ounce, which could be purchased for a halfpenny There were no further cases after Saturday, September 6th, so far as the Health Department is aware, except for one child who was given a sweet purchased several days before The question as to how the man who sold the arsenic, which was pure arsenious oxide, came to have it in his possession is now a police matter, but it would suggest that some tightening of the regulations concerning the sale of arsenic is necessary, as I am informed that one can purchase large quantities from colour merchants and manufacturers with little or no trouble The difficulty in tracing the source of the bottles of sweets was greatly hampered by the lack of book-keeping on the part of the manufacturer and *the wholesalers* The enormous quantities of arsenic used as a dusting powder in the process of manufacture had also permeated almost all the ingredients in the works, and arsenic has already been found in quite large quantities in treacle and several other substances

The source of the arsenic which was sold as dusting powder to the manufacturer has been found to be from a box of pure arsenious oxide found on the engineering works where the man who made the boiling for the factory had resided The explanation of its presence on the works was that it had been left there by a previous lessee of the works, who made enamel letters for shop windows This man is now in America, so it has not been possible to trace where the arsenic was manufactured The whole of the arsenic is now being destroyed, so that no further cases can arise from this source unless from sweets already purchased of which the Health Department is unaware

The lesson of the whole case would seem to be that there should be more control over all premises where food or sweets of any kind are manufactured Such premises can always be entered by a medical officer of health or his representative, but the existence of such premises is often unknown, and I would suggest that notification of the commencement of such a business should be made to the authorities Another point of extreme importance is the ease with which large quantities of arsenic can be purchased from manufacturers such as colour merchants, and over the sale of which the police have no control Further, it seems that some legislation is necessary to prevent a case like the present, where a manufacturer on vacating the premises can leave a large amount of a deadly substance such as arsenic without any label or means of telling its noxious nature Surely such deadly poisons should never be lost sight of, but should be returned to the manufacturer or their presence reported to some authority I would suggest that the attention of the Home Office should be called to such a situation, which could obviously arise on some other occasion

As I have already stated, the circumstance that surprised me more than any other was that there were no deaths, in spite of the fact that these sweets, heavily contaminated with arsenic, were sold at one halfpenny an ounce The manufacturer and his son have both suffered severely from the effects of the arsenic—irritation of the skin, especially on the hands, forearm, and face, as well as pains and diarrhoea due undoubtedly to eating food with hands contaminated during the making of the sweets

THE BRITISH ASSOCIATION

ANNUAL MEETING IN BRISTOL

(Concluded from page 491)

SEVERAL topics of direct or indirect medical interest were discussed during the annual meeting of the British Association at Bristol, which terminated on September 10th. We referred last week to the two presidential addresses in the Sections of Physiology and Psychology respectively, and it is not possible to do more than indicate certain other topics which were dealt with. In the Section of Psychology Professor C. W. Valentine devoted himself as president to the consideration of the psychology of early childhood and some kindred aspects of this subject received detailed attention later.

The Pre-School Child

In the Section of Educational Science Miss Margaret Drummond urged the necessity of a healthy educational environment for the early years of life. Solution of the housing problem, even associated with the training of the ignorant mother and her freeing from other responsibilities in order that she might attend to her children, was not in itself an adequate measure, for the 3-year-old child, like his older brothers and sisters, had needs which no mother could fully satisfy. A child's development should be continuous and be safeguarded from sudden changes in environment—as for example an abrupt transition from the nursery school freedom to the cramping and deadening mass instruction provided in many infant schools. Dr. W. E. Blatz described the methods adopted in the clinics and schools of Toronto to keep children off the "psychological rocks." He said that the background of personality was laid down in the first five or six years of life in the winning of control over attitudes, appetites, and emotions. The mother of a child in the Toronto nursery school attended courses in parental education for three years. Dr. J. A. Hadfield (London) show how false attitudes to life adopted in the pre-school period resulted later in adult abnormalities of character and personality. Prevention of these faults was obviously better and easier than their cure. Full and harmonious expression of the child's personality in legitimate accordance with its environment was essential to health, and could be achieved by the fostering of the quality of self-discipline, which was latent in every child. The imposition of ideals, such as discipline and considerateness, qualities desirable in themselves, might easily lead to mental morbidity, no discipline was of any value which did not lead to self-discipline. Mrs. S. Isaacs discussed the relation between thought and fantasy in young children.

The Psychology of Adolescence

Various aspects of this subject were dealt with by speakers. Professor Olive Wheeler defined three emotional developments characteristic of this period—namely, the increased feeling for self, tending to the development of psychological independence, and the finding of a vocation, the appearance or intensification of sexual emotions, tending to the development of hetero-sexuality and finding a mate, and the evolving of social, aesthetic, and religious emotions leading to the formulation of a working philosophy of life. Variations occurred among normal adolescents as regards the time and rate of emotional developments, the relative emphasis laid on differing ones, and the "conflicts" which might ensue. Moreover, environmental influences had their part to play, the family circle, educational institutions, modern industrial difficulties, and religious organizations might have good or bad results as regards the developing personality and the physical and mental health.

Dr. R. G. Gordon emphasized the importance of problems of adjustment being tackled healthily and outlined the way in which introversion should proceed to extraversion, the quality of the social being. He then dealt with the the quality of the social being. He then dealt with the herd instinct, the ill-defined instinct of suggestion, primitive sympathy and imitation and the ex instinct: these three had to be integrated with each other and with other emotional dispositions as well as with physical factors. Study of the mental defective, Dr. Gordon remarked, supplied a slow motion picture of the development of the social self. Such a defective did not lack any of the instinctive bases of the social self but he was deficient as regards integration, discrimination and control and therefore in the power of social adjustment. These missing functions were cortical in nature, and the amentlacked an efficient cortex. Hughlings Jackson's work had revealed how the cortex was concerned with control. Sherrington had shown how it was involved in integration, and Head had illustrated the faculty of discrimination. These functions were related to adaptation, which could only be achieved by a fully developed cortex. Recent work by Drs. Gordon and Thomas had thrown light on the continued development of the mentally defective, and the late adjustment to social conditions made by backward children. Amentia was not solely deficiency of intelligence, it included a group of cases showing deficiency in social adjustment, and divisible into those who compensated by excessive egocentricity (often epileptic), and those who were generally inefficient (psychasthenic). All psychoneurotics were not defective, but many of those regarded as psychoneurotic were really suffering from a degree of amentia. Miss A. H. McAllister described the adolescent modes of thinking, and Miss M. Phillips discussed the adolescence of the wage-earner.

Psychology of the Tuberculous Patient

Dr. H. Banister, in a paper dealing with the mental effects produced by tuberculosis, described the discoveries which had been made at the Papworth Village Settlement. Tuberculosis had there been shown to be not necessarily hereditary, and even though 173 children had been born there of tuberculous parents, and had lived the ordinary family life with them, not one had contracted the disease. He did not agree with those who assumed that genius was one of the products of tuberculosis, though to be crippled by the disease might supposedly give rise to imaginings of what might have been the career otherwise, such imaginings being the very essence of the art of romance. The 'spes phthisica"—the planning of grandiose schemes by the obviously moribund—was less usual than was generally believed and constituted a state of dissociation. Similar dissociations were fairly common, forming the basis of many novels, in the consumptive the patent fact that he was doomed to early death might be concealed from him by an unconscious process of this kind. Such a hopeful mental attitude might promote cure in cases of less severity. The patient must be shown that life was still worth living though not on the scale previously planned. Such considerations offered a possible explanation of the fact that the expectation of life at Papworth was about three times that given by ordinary sanatorium statistics. It had to be remembered that the patient was not cured when he left a sanatorium, the disease was only arrested. Moreover, he might be going back to the very environment in which he had broken down, and the worry and difficulties consequent on his return were bound to bring about relapse eventually. After the arrest of the active process the patient should adopt suitable work under adequate medical supervision: this was the line on which the Papworth treatment proceeded.

Colours and Colour Vision

Dr. J. Drever, in the Section of Physiology opened a discussion on the definition of primary colours, showing that there were four different view-points in this respect—namely, those of the artist, the physicist the physiologist, and the psychologist. While the artist and physicist applied the same logical principle of classification—the admixture of three pigments or lights—the psychologist and physiologist maintained that colour was a phenomenon pertaining to their special sciences. Standardization by wave-lengths offered a better basis for classification and it would be well to discontinue use of the undefined term "primary." Professor H. E. Roaf discussed the mode of production of colour sensation with special reference to the histological structure of the human and avian retina. Dr. R. J. Lythgoe suggested a correlation of the different standpoints. Dr. F. W. Edridge-Green read a paper on pseudo-isochromatism and the detection of colour-blindness, and

reported the results obtained by an examination of cases at the Board of Trade He concluded that a test for a dichromic would not necessarily detect a trichromic who had the three colour sensations—red, green, and violet—but no yellow sensation, and who was obviously dangerous, as was shown by the lantern and spectrum tests He emphasized the value of his own "card test" in this connexion A test which was difficult for the normal sighted was not necessarily so for the colour-blind In fact, a test might be constructed which could be passed by the colour-blind but not by those with normal colour vision

Chemotherapy

In the two Sections of Chemistry and Agriculture attention was paid to the value of chemotherapy in human and veterinary medicine The President of the latter Section, Dr P J DuToit, in his address on veterinary science and agriculture, reviewed the notable advances made in recent years, with special reference to trypanosomiasis and its arsenical treatment, and the piroplasmoses, such as redwater and biliary fever, which yielded to trypan blue In the Section of Chemistry Dr A J Ewins read a paper on the application of arsenicals to tropical medicine, and Dr H King described the mechanism involved in the action of these substances Dr T A Henry described the derivatives of quitenine A discussion on the present position of the dyestuff industry in the same section was opened by Professor A G Green, F R S, who gave an account of the advances made since 1914, and eulogized the Dyestuffs (Import Regulation) Act which came into force in January, 1921

Ireland.

Northern Ireland Insurance Act.

THE National Health Insurance Act, which received the Royal Assent at the close of the last session of the Parliament of Northern Ireland, established a scheme of medical benefit for persons insured under the national health insurance scheme All persons who are insured under this particular scheme, with the exception of voluntary contributors whose incomes exceed £250 a year, and a limited class of deposit contributors, will be entitled to medical benefit, which begins on October 1st, 1930 Unlike the cash benefits under the health insurance scheme, medical benefit will not cease at 65 years of age, but will continue for life Every qualified medical practitioner in Northern Ireland is entitled to undertake the treatment of insured persons, and a list will be prepared by the Ministry of Labour, the Government department responsible for the administration of the scheme, showing the names and addresses of the doctors who have agreed to do so This list will be compiled by county areas, and the appropriate district list will be displayed in employment exchanges and post offices Any insured person is entitled to choose as his doctor any doctor practising in his district whose name is on the list, and who is willing to accept the insured person as a patient During the next few weeks the Ministry of Labour will send a medical card to every person entitled to medical benefit This card, besides being proof of title to medical benefit, should be used by the insured person when selecting his doctor He need only take the medical card to the doctor of his choice, who will send it to the Ministry of Labour as a notification that he has accepted the applicant as a patient, and the card will then be returned by the Ministry of Labour to its holder As a consequence of the introduction of medical benefit, sanatorium benefit will cease to be one of the benefits under the national health insurance scheme after September 30th, 1930, from that date the County Insurance Committee will cease to exist Insured persons suffering from tuberculosis, who are now being treated in their own homes under the sanatorium benefit arrangements, will in future be given treatment by their own doctors, and supplied with medicines under the medical benefit scheme The arrangements for other forms of treatment for tuberculosis will however, be in the hands of the County Tuberculosis Committee.

Peamount Settlement for Tuberculous Patients

The Irish Free State Department of Local Government and Public Health has agreed to the payment of a special weekly fee in respect of every patient who receives industrial training at the village settlement which is being established in connexion with Peamount Sanatorium near Dublin In a letter recently addressed to the boards of health the Peamount committee of management states that important developments have taken place during the past few months Thirty-one patients are now receiving industrial training, concurrently with medical treatment, with a view to their becoming permanently employed by the Peamount industries Goods are being produced and sold on an economic basis, so that patients who eventually become permanent employees will be able to maintain themselves and their families at little or no cost to public funds At the same time, they will remain under medical supervision, so that the relapses, or breakdowns, which form so prominent a feature of tuberculosis after-care, may be avoided, and the risk of infection limited Special stress is laid upon the fact that, while the fees now approved are no higher than those payable in respect of patients treated at ordinary sanatoriums, the Peamount institution can offer additional benefits which are unique The latter states that at Peamount it is now possible not only to provide full sanatorium treatment with occupational therapy of a purposeful kind, but, further, to develop this occupational therapy into a permanent paid employment for suitable cases In inviting boards of health to send tuberculosis patients to Peamount for treatment and training, with the object of permanent settlement, the Peamount committee declares its intention of providing a village settlement for the tuberculous of the Irish Free State, and hopes that its success may emulate that already achieved by the Papworth Village Settlement in Cambridgeshire, which has been described as "the most important international demonstration of anti-tuberculosis work at present being carried on anywhere" At the request of the Marchioness of Aberdeen and Temair, president of the Women's National Health Association, Dr P C Varrier Jones, the founder and medical director of Papworth, has undertaken to supervise the development of Peamount, so that it may proceed along lines that have proved to be successful

Meals for School Children

The annual report of the Ministry of Education of Northern Ireland states that schemes for medical inspection of public elementary school children are in operation in all areas except Derry City and County Armagh Outside the city of Belfast, committees have evidently not attempted to cope with the question of providing at least one free meal daily to necessitous children in town and country The winter proved only too clearly the need for concerted philanthropic endeavour in this direction Badly nourished and ill-clad children were seen even in some of the rural schools, where the provision of a hot meal at midday would have done much to save them from becoming a permanent burden on the State owing to physical weakness According to a report there is no reason to fear that service of this kind in season will produce pauperization

Scotland.

Changes in Edinburgh Public Health Department

DR WILLIAM ROBERTSON, who had been medical officer of health for Edinburgh for over seven years, retired from the position on September 8th, when he was succeeded by Dr John Guy Many useful contributions, to both the literature and practice of public health, have been made by Dr Robertson during his tenure of office While medical officer of health for Leith, prior to his appointment in Edinburgh, he manufac[illegible]pioneer in the work of the medical inspection [illegible]om the effects [illegible], and drew up an exhaustive report on [illegible]ecially on the hair pupils in Leith before these examinat[illegible] and diarrhœa du[illegible]d in other places He was also [illegible]lands contaminated dur[illegible]; protective inoculation of

school children against diphtheria He is well known as an organizer of successful health exhibitions, and as a popular lecturer in health subjects His book on *Sanitary Law and Practice*, now in its sixth edition, and his work on *Meat and Food Inspection* are among the textbooks used by those qualifying for the diploma in public health During the war, in conjunction with Dr Oliver of Roxburghshire, he designed a steam disinfector, which was used by several of the allied armies

It was intimated at the meeting of the public health committee of Edinburgh Town Council on September 9th, that Dr John Guy had been appointed lecturer on public health at the University of Edinburgh in succession to Dr Robertson At the same meeting Dr H C Elder was appointed tuberculosis officer for the city in succession to Dr Guy Dr Elder graduated M B at Edinburgh University in 1917, and was assistant for a time to Sir Robert Philip, professor of tuberculosis in the University He was afterwards transferred to the public health department of Edinburgh as deputy tuberculosis officer

On September 11th Dr John Guy was entertained at a luncheon by the Rotary Club of the city, and gave an outline of the present state of the public health services in Edinburgh In that city, he said, there were ten subdepartments in public health, of which eight were directed by medical men, one by a veterinary inspector, and one by the sanitary inspector Seventeen years ago the total sum expended on public health was £35,000 per annum, while the estimate for the present year amounted to £347,000 The oldest special department was that of tuberculosis, which had three medical officers and a large staff of nurses, but he believed that the time would come when this department would disappear In the child welfare department there was a medical officer with four assistants and a large body of nurses The venereal diseases department had been set up during the war, and was administered in conjunction with the Royal Infirmary, where all the expenses incurred in connexion with this disease were paid by the city The inspection of school children was under the care of a medical officer with four assistants, no recent advance in public health showed better results than did school inspection, which had been responsible for a marked improvement in the general growth and physique of the children A new charge had been laid upon the public health department in the care of the sick poor, who numbered about 700 They were admitted to the hospital at Seafield, formerly a poorhouse, which now provided the highest standard of medical treatment The department had also taken over Bangour Asylum, which had 1,000 inmates, and also the care of the mentally defective, for whom an institution was being erected at Gogarburn

Sanitary Congress in Edinburgh.

The Royal Sanitary Association of Scotland, instituted in 1875, held its annual meeting at Edinburgh on September 10th and 11th The delegates were welcomed by Lord Provost T B Whitson, who referred to the excellence of the work carried on by the association While the provisions of the Local Government Act of 1929 might be difficult of adjustment, they made towards the uniformity and extension of health services, and the future might be regarded with great confidence The public conscience had been awakened since the war to the evils of bad housing conditions, and the new Housing Act of 1930 gave an impetus in dealing with the slum problem He thought that they must get rid of the idea that slum dwellers would create slums wherever they went and look forward to a time when a generation brought up under the influences of food, air, light, and sanitation and the beauty of small gardens would change the whole of life There was some danger that in clearing slums municipalities might work on a patchy system, he thought that there was sometimes wisdom in a bolder policy that effected clearances which might be used for the better architectural and business development of the town No official efforts of a department could have brought about the present extensive system of public health administration unless the feeling of the citizens had been behind it While civic government was carried out more and more by experts care was necessary that the old mistake should not be repeated of taking away responsibility and interest from the community A discussion on gas undertakings and smokeless fuel in relation to public health was introduced by Sir William E Whyte, chairman of the Scottish executive committee of the National Gas Council He gave statistics showing the relation between an increase in the use of gas and a purer atmosphere In Glasgow in 1915–16 the fall of soot was 450 tons per square mile, in 1921–22 it had been reduced to 241 tons During the interval the increase in the amount of gas supplied had exceeded 500 000,000 cubic feet Sir William remarked that some public alarm had been caused recently in regard to the dangers that attended the use of gas, and the fact that gas was largely used by suicides He considered however, that the number of accidents caused by gas poisoning was very small in comparison with accidents from other causes, and the abuse of gas by a small section of the community was no reason why its proper use should be discouraged, because the people who committed suicide would still do so if gas was not available A lecture was delivered by Mr Gilbert Thomson on progress in sanitation, dealing chiefly with water supply, drainage and sewage He pointed out that the progress which was specially needed in the future concerned the improvement of rural water supplies, and that these could probably be most easily provided by comprehensive undertakings A discussion on housing was opened by Mr Allan W Ritchie, chief sanitary inspector, Edinburgh, who said that the great task of slum clearance and housing improvement had recently become a party cry of politicians Many persons were of the opinion that slum conditions were largely due to careless and destructive tenants, but he was compelled to correct this erroneous view, for while bad tenants might contribute to the evil, the main causes were site congestion, subdivision, overcrowding, and lack of sanitary conveniences Powers for improving the housing of the working classes had been available since 1890, but the results obtained up to the present time had been very meagre There had been a process of condemnation, demolition, and clearance of congested areas, and in recent times large numbers of modern dwellings had been erected by local authorities These efforts, however, had only touched the fringe of the problem Local authorities had estimated after 1919 that 34,755 houses were necessary to replace houses that should be closed and demolished while a further 41 820 were required to meet cases of overcrowding In the annual report of the Department of Health for Scotland for 1929, it was stated that the total number of houses dealt with in the ten years had been 14,527 In his opinion the problem could be solved within twenty years if the local authorities faced the situation seriously The question was one of finance for in order to build houses at the present cost and let them to the citizens who urgently required them at a reasonable rent, they would have to get the money for nothing, thus the private builder was excluded until he was in a position to build freely as in pre-war days Dr Clark, assistant medical officer of health for Glasgow, pointed out that the Act made provision for hostels, and there might be some inducement for local authorities to erect such places because anything which would do away with the one-roomed house would be welcome A discussion on rural housing was opened by Mr James T Storry county sanitary inspector for Midlothian who said that there was little difference in the housing problems of rural and urban areas About 43 per cent of the new houses estimated to be required were needed in landward districts, including agricultural, industrial, mining and crofting areas This shortage had not been remedied since the war The necessarily isolated sites of these houses tended towards a low standard of sanitary services and it was often found that all sanitary conveniences were absent unless provided by the occupier The houses were generally, however, of substantial structure,

and could be reconditioned at much less cost than a new building, so as to conform with the highest present-day standards. The Housing (Rural Workers) Act, 1926, had offered an unprecedented opportunity for making a marked impression on housing and extensive improvements had already been carried out under the Act. The process of bringing housing conditions up to a satisfactory standard in rural areas must, however, necessarily be slow.

The Scottish Western Asylums' Research Institute.

Dr Sarah H. Maclachlan, director of the Laboratory of the Scottish Western Asylums' Research Institute, gives an account in her report for the year ended December, 1929, of an investigation she carried out in conjunction with Dr. A. S. Paterson on the blood sugar reaction to insulin in the psychoses. In the *Archives of Neurology and Psychiatry* (January, 1929) Appel and Farr had stated that a relatively sharp fall in the blood sugar to the extent of 29 per cent. took place in most cases within ninety minutes of the injection of 5 or 10 units of insulin, and that the recovery process was more gradual and not complete in three and a half hours. These results Drs. Maclachlan and Paterson were able to corroborate. Further, they investigated ten cases on lines suggested by Appel, Farr, and Marshall, who had studied the effect of insulin on the under-nutrition of patients with psychoses. The method consisted in giving the patient increasing doses of insulin each day for a month, beginning with 10 units and working up to 40 or 45 units. The dose was then gradually lessened, and a course of over-feeding without insulin administration was adopted for another month. In all cases a special diet of 4,000 calories was given. In the third month the patients received the special diet with insulin. No change was found in the character of the blood sugar curve, as far as the patients' condition was concerned, a few gained weight, in some the weight remained stationary, and in all the mental condition was unchanged.

India.

Medical Aid for Women in India.

THE annual reports for 1929 of three separate organizations under the presidency of Lady Irwin have been issued in a single volume. These organizations are the National Association for Supplying Medical Aid by Women to Women of India, which incorporates the original Dufferin Fund and the Women's Medical Service, the Victoria Memorial Scholarships Fund, and the Lady Chelmsford All-India League for Maternity and Child Welfare, including the Lady Reading Health School. In the introduction to this volume tribute is paid to the valuable work accomplished by the late Marchioness of Reading, who was president of the various funds when important administrative changes in their management were brought about. Among other services she appointed a committee which enabled the various organizations to become more closely related thereby effecting helpful economies, her sympathy and active support were largely responsible for the establishment on a sound basis of the hospital at Simla and the health school at Delhi, and she used her influence to promote the annual holding of baby weeks in widely scattered centres in India. The financial condition of the Countess of Dufferin's Fund has slightly improved during the period reviewed in the present report, although no increased help was received from the Government of India. Serious overcrowding and financial stringency continues to handicap certain hospitals in which the Women's Medical Service is functioning, but increases in staff are reported in the United Provinces and the Central Provinces. A more definite effort is now being made to reach the women in rural areas in the United Provinces. Regional conferences have been arranged by the Victoria Memorial School Fund to discuss the training and work of nurse midwives. This new departure has proved very popular, for it has provided an opportunity for delegates to exchange their varied experiences. Details are given of the steps taken to instruct these women, and some of the difficulties encountered are enumerated. In the report of the Lady Chelmsford League special attention is paid to health schools, it is mentioned that the grants-in-aid which have been contributed have proved particularly useful in that they have been made conditional on satisfactory instruction being given. These schools train women more especially for child welfare work, they now exist in all the large provinces of India except Bihar and Orissa, and Assam. Since the requirements of these two provinces are being met by other health schools, there is no need at present for special schools to be established by the League. Accounts of the work in progress at various branches and schools are published, and the impression produced on reading the report is one of admiration for the immense amount of devoted service rendered by the health workers. Baby weeks and health schools continue to gain popularity, and are found to have more than a passing influence because they create a desire for permanent health work in centres where hitherto little has been done. Such activities as general improvements in hygiene, the correction of imperfect sanitation, and the improvement of water supplies are among the useful results of these baby and health weeks.

Progress of Vaccination in the Punjab.

In commenting on the rapid progress of vaccination in the Punjab during the triennium 1926 to 1929, Lieut.-Colonel C. A. Gill, I.M.S., director of public health, Punjab, emphasizes that both primary vaccinations and revaccinations must become much more general before effective control can be exercised over small-pox. Vaccination, he points out, is the only means of protection at present, since hospitals for segregation have not been established. The disease is apparently much more widespread than official statistics suggest, it is reported to be nearly twice as prevalent in the towns as in the rural areas. A great obstacle to early treatment seems to be the public attitude in regarding small-pox as an inevitable evil, to be concealed as long as possible. It is rarely notified, even in municipal towns, and the danger of allowing infected persons to appear in public is not realized. A striking instance, already referred to in these columns, occurred recently in Lahore, where the parents of a student who was found to have small-pox brought an action against the university authorities for refusing to allow him to continue an examination. Apart from the education of the public—which was actively maintained by propaganda—the extension of facilities evidently depends mainly on increasing the number of local vaccination establishments, and on the enforcement of the Vaccination Act and of the regulations framed under it by local authorities. During the triennium the Act was adopted by fifty-three municipal and small towns, but the arrangements for vaccination in municipal towns is considered to be unsatisfactory. Although all of them have adopted the Act, many had made no regulations at the date of the report, while in others such regulations as had been passed were a dead letter. By the Vaccination Law (Amendment) Act, 1929, district boards are now empowered to make vaccination compulsory in any part of the area under their jurisdiction. Another preventive measure, instituted during the triennium, was a scheme for the employment of female vaccinators for women. Training in vaccination has been added to the curriculum of the Punjab Health School, and health visitors carry out vaccination as part of their ordinary duties. The total number of operations performed during the period was over four million, the highest recorded, being an increase of more than 919,000 over the figure of the previous triennium. An increase of 212,272 operations is reported for the year 1928–29 over the number of the preceding year, the increase in respect of primary vaccinations and revaccinations being 93,889 and 118,383 respectively. The results are attributed partly to the larger number of vaccinators available, partly to the exceptionally high birth rate and low infant mortality rate, and partly to the healthiness of the year, which enabled a close supervision to be maintained over the vaccination staff.

Correspondence.

THE RESEARCH DEFENCE SOCIETY

SIR,—I wish I could persuade more members of the medical profession to be subscribers to the Research Defence Society

We do not need any large sum, but if we could get two hundred more annual subscribers of £1 it would make our work easier to carry on We are the only society that exists to expose the misstatements of the anti-vivisection societies and agitators They preach that all experiments on animals are useless, that no good has come from them to man or beast, and that the experiments are grossly cruel

An uninformed public accepts such statements as true and the only way to get the facts known is by the propaganda of a society such as ours But this is expensive and so I ask the help of those who wish it well —I am, etc,

11, Chandos Street, Cavendish Square, London W.1 Sept. 13th KNUTSFORD Chairman Research Defence Society

PERFORATING DUODENAL AND GASTRIC ULCERS

SIR,—I read Mr John Watson's paper on acute perforating duodenal and gastric ulcers in your issue of August 2nd with interest, and I have also noted the discussion in your correspondence columns on this subject I should like to add my comments on 101 cases operated upon by me between the years 1920 and 1930 at the two hospitals in Bradford, including also private cases

Of these 101 cases, 12 died, giving a mortality of a decimal under 12 per cent Of the 12 who died, 3 were over 70 years of age, of the remaining 9, 3 were operated upon thirty six hours after perforation Of the remainder, one persisted in going to the St Leger after perforating in the train, another perforated in the ward and was taken immediately to the operating theatre The remaining four perforated on a full stomach the perforation in each case being as large as a sixpenny piece Shock in the latter cases was extreme, and there were no signs of improvement with resuscitative measures

My own experience is that immediately after perforation there is an interval of intense shock in which it is unwise to operate Transit to hospital or home only aggravates the shock, and it is always preferable to wait two or three hours, during which resuscitative measures should be employed Of these the best are radiant heat with saline and glucose, with brandy given per rectum If no improvement occurs from these measures, as happened in four of these cases, the outlook is extremely grave Spinal anaesthesia is unquestionably the one of choice This allows the operation of suture to be performed through a minimal incision and therefore the minimum of exposure—hence the minimum of shock A roll of gauze is first introduced into the kidney pouch and all exudate is absorbed A rubber drain is left in extending to the bottom of the kidney pouch and this is removed at the end of forty-eight hours Nothing further has been done either by way of more extensive drainage (a useless business) or of more heroic measures such as gastro-enterostomy

Only 8 of these cases have returned with symptoms of obstructive ulcer, and these have been dealt with successfully I have seen many of the others since who are now in good health and have no symptoms A few I cannot account for Of my 101 cases, 16 have occurred in the better classes (16 per cent)—business men and heavy cigarette smokers, 5 occurred in women Of the remainder the preponderance has been in such occupations as postmen tramway men, and men following irregular occupations where meals are taken irregularly and combined with the inveterate habit of cigarette smoking I am convinced that this latter pernicious habit has a great bearing on gastric and duodenal crises Combined with irregular and unsuitable food the ideal conditions for ulcer and perforation are established

What are we to do to reduce the mortality? Looking down the list published by Mr John Watson in the *Journal* of September 6th I find that the mortality is far too high To see mortalities of over 20 per cent against the names of distinguished surgeons takes considerable explaining against my own of 12 per cent for my own manipulative and surgical skill and experience can only pale before theirs and I recognize this fact from my elders The only explanation is the anaesthetic employed, and I feel sure that if spinal anaesthesia or infiltration anaesthesia (as I have often employed) were used the mortality from perforating ulcers would reach a far lower standard —I am, etc

Bradford Sept. 11th. BASIL HUGHES D.S.O., M.A., M.B., B.Sc., F.R.C.S.

SIR,—The following case may be added to the list Mr Russell Coombe has given of operations for perforated gastric ulcer in the early days of the operation

On September 15th 1894 I was sent for to see a young woman who had been seized with sudden pain in the abdomen at 9 p.m. I sent her into the Royal Berkshire Hospital, and at 10.30 on the following morning—thirteen and a half hours after the perforation—the late Mr James Hopkins Walters operated and sewed up a small perforation The patient recovered

I have a vivid recollection of the Simon and Barling case at the General Hospital Birmingham as I gave the anaesthetic No time was wasted in getting the operation done but there was an unusually large amount of stomach contents in the abdominal cavity, and I think the death was due to this —I am, etc,

Reading Sept. 1th G. H. R. HOLDEN, M.D.

ETIOLOGY OF PUERPERAL SEPSIS

SIR,—Dr Colebrook is entirely at fault (September 13th p. 446) in suggesting that we have attached insufficient importance to his paper on anaerobic streptococci in puerperal fever (July 26th p. 134) We did but seek to learn the relationship of these new cases of mixed anaerobic streptococcal infection in the puerperium to the clinical condition diagnosed puerperal thrombo-phlebitis We still await instruction on this point

Dr Colebrook states in his letter that 'there was definite evidence of thrombo-phlebitis in only one third of the cases giving positive blood cultures of anaerobic streptococci" The impression given by his original paper is as follows (1) Emphasis is laid on Schottmuller's findings that the clinical conditions most frequently associated with infections by *Streptococcus putridus* were subacute and chronic thrombo-phlebitis affecting the parametrial venous plexuses and salpingitis" (2) Six complete cases in Dr Colebrook's series came to necropsy, in four septic thrombosis was found in pelvic veins and in the other two infarcts were demonstrated (3) Dr Colebrook's description of the clinical features of his cases runs 'there is usually no pain and little can be made out by physical examination except perhaps a slight tenderness on deep palpation over the brim of the pelvis—a sign which can often be related at necropsy to a septic thrombus in the ovarian veins' We submit that no alternative was left to us save the reasonable interpretation advanced in our letter (August 23rd, p. 305) that Dr Colebrook has been concerned with the clinical state known as pelvic thrombo-phlebitis in the puerperium

Dr Colebrook misquotes our letter of August 23rd in that he states that 'Dr Armstrong and Mr Burt-White infer that these microbes can do little harm to human beings' Our letter contains no such suggestion All that we affirmed was our personal experience that the anaerobic streptococci were normal inhabitants of the genital tract and of low pathogenicity Our tests were made on laboratory animals Dr Colebrook records no animal tests in his paper We by no means denied (vide our letter) the potential danger from these organisms when the factor of trauma becomes superimposed

We cannot seriously accept Dr Colebrook's declaration that (in his own words) most of our discussions about

the etiology of puerperal fever are but waste of time" So reactionary a spirit in a scientific worker is surely to be deplored —We are, etc,

RICHARD R ARMSTRONG
HAROLD BURT-WHITE

London, E C 1, Sept 13th

THE TREATMENT OF PRURITUS ANI AND ANAL FISSURE

SIR,—In the *Journal* of August 30th (p 311) Mr Gabriel advises 10 c cm of A B A solution as the initial dose, this large amount is in marked contrast to the 2 c cm he recommended previously (June 15th, 1929) I have found A B A very effective in the smaller dosage, and would be chary, despite Mr Gabriel's reassurance, of using 10 c cm initially, for the following reasons Injection of large quantities of oily solutions—for example, 5 to 15 c cm of 5 per cent phenol in oil—was formerly used extensively for haemorrhoids, especially in America (Mitchell, 1871) Pyrexia, rigors, and extensive inflammation frequently resulted, and many deaths were reported (Andrews) Except amongst a few practitioners here and on the Continent the treatment was abandoned years ago The outstanding point noted was that marked idiosyncrasy (pyrexia, rigors, collapse) to *large* doses of oily solutions was frequent I recently saw a pitiful case following injection of 15 c cm of 5 per cent carbolized oil, the patient was disabled for two months

In my opinion the initial dose of all local anaesthetics, oily or aqueous (I have used the latter extensively in pruritus), should be small, to test the patient's susceptibility, Mr Gabriel's "knock-out blow" theory for the pruritus is admirable provided there is no risk of the *patient* having to take the count The ideal is not to give the maximum but the minimum dosage necessary to stop the pruritus One can always increase the amount I have used and advocated anaesthesin for many years, and for that reason prefer Mr Gabriel's oil solution of that drug (A B A) to the many others now recommended

He states "In pruritus ani it is only the intractable cases which need treatment by injection of A B A three doses—10, 5, and 5 c cm—of A B A *is sufficient for cure*" (The italics are mine) As this large initial dosage has only been given in recent months (a year ago his advice was 2 c cm), I hope I will not be considered carping if, whilst congratulating him on his success, I say that a longer experience will be necessary before so definite an assurance as "cure" can be given for such an intractable complaint If injections give complete relief for even six months their value will be great, as they can easily be repeated and will supersede all undercutting operations

Spinal anaesthesia with forcible dilatation of the sphincter to admit five or six fingers is drastic treatment for fissure Neither as house-surgeon and temporary assistant surgeon at St Mark's Hospital nor in private practice have I seen a case needing it A chronic fissure, no matter of what type, is only an ulcer, when relaxation of the sphincter is obtained by local anaesthesia and the fissure incised, it should then be treated as are ulcers elsewhere The diamond-shaped incision (one-third in the anal canal, two-thirds on the skin) employed in my time at St Mark's Hospital has the advantage of the large triangular incision recommended by Mr Gabriel (the diamond is simply two smaller triangles base to base) without the disadvantage of having a wide, sore skin area—that is, the base of the larger triangle—much of which does not help drainage The "inevitability" of the healing of the anal wound will depend more on its treatment than on the shape of the skin wound

A special fissure speculum made to my design by Messrs Bell and Croyden some years ago enables me after anaesthetizing the sphincter to investigate fully any type of fissure without forcible dilatation It is about twice the length of the "Mummery" speculum, its groove being prolonged to the tip, so that the speculum does not come in contact with the fissure —I am, etc,

London, W C 1, Aug 31st P KENNEDY MURPHY

GENERAL EDUCATION OF THE MEDICAL STUDENT

SIR,—Professor Dean, in his very able article in the Educational Number of the *Journal*, published on September 6th, emphasizes the point that the general education of the medical student is in danger of being neglected Everyone will agree with him, but something more than agreement is needed I think he may approve my contention that the best thing that can be done for the profession of medicine, or indeed any other profession, is to devise some method whereby the number of men therein with first-class literary attainments can be increased I submit the following ideas for his consideration and support

The General Medical Council should issue a regulation that men who take a first in "Greats" at Oxford or a similar degree in classics and philosophy at Cambridge, and desire to enter the profession of medicine, may ignore the time table and regulations incumbent on others, being required merely to become attached to a medical school and to pass the examinations An Oxford don once remarked to me "If the G M C would act thus, they would get the men" What more do we want than to achieve the utmost that can be done for any profession? We all learn medicine after we have taken our degree I submit that it is quite unreasonable to ask, as the G M C does, that a man with first-class literary attainments should go through a course laid out for the average medical student —I am, etc,

London, W 1, Sept 10th DAVID ROXBURGH

TECHNIQUE OF INJECTING VARICOSE VEINS

SIR,—I have followed with interest the series of letters which have recently been appearing in the *Journal* on the treatment of varicose veins by injection There is no doubt that as a valuable therapeutic measure this method has come to stay It appears to me that one point which is insufficiently stressed by writers on the subject is the essential simplicity of the method as regards both the patient and the practitioner The description of numerous varying points of technique tends to render the beginner doubtful which to employ, whereas all that is required to achieve satisfactory results is what the law demands—namely, the employment of reasonable skill and care In dealing, however, with large numbers of hospital out patients a method must be adopted which is not only simple and efficient, but which takes the minimum amount of time There are two points which I believe are of the greatest importance in achieving this end—namely, the use of suitable needles, and the standing position for the patient on a couch or chair

The advantage of using a needle which is short in length and short in the point, instead of the ordinary hypodermic variety, cannot be over-emphasized The only drawback is that these needles require more frequent sharpening or renewal, but so long as this is attended to there is no danger of missing the vein nor of the needle-point slipping out while the injection is being given Such needles are either in the vein or outside it, and the preliminary attempt to withdraw blood decides which is the case The standing posture of the patient has the following advantages It obviates the use of a tourniquet, and gives the surgeon the best possible access to any part of the leg or foot without requiring him to crouch on the ground, at the same time it enables him to steady his arm on the couch while giving the injection

In other points the technique adopted is similar to that described by Dr Noel Scott in the *Journal* of July 12th (p 58), except that quinine and urethane in 2 c cm ampoules is the only solution used By commencing with an initial 1 c cm dose, continuing with weekly injections of not more than 2 c cm, and always applying a firm pad and bandage immediately after the injection, no untoward reactions have been noted in a series of 100 cases With regard to 10 per cent sodium morrhuate, I have not found it so satisfactory a sclerosing agent as quinine urethane, moreover, its oily nature renders the thorough cleansing of the syringe between injections more difficult In fact, its

only advantage appears to be that it is less liable to cause a slough if the vein is missed, an accident which I believe can be entirely avoided by the employment of short-pointed needles and the prevention of any extravasation of blood by a firm pad.—I am, etc.,

London, W.6, Sept. 15. CHARLES R. McCASH, M.B., F.R.C.S.Ed.

THE PERFORMANCE OF POST-MORTEMS BY CENTRAL PRACTITIONERS

SIR,—Though I have retired from active work I find this correspondence extremely interesting. Many years ago, as county medical officer of the West Riding of Yorkshire, I conferred with the coroners of the Riding—able and progressive men—about initiating a position such as "county autopsy officer", and, with the permission of the Public Health Committee, I delegated these duties to the bacteriologist, now designated also "county pathologist" who as far as his laboratory work would allow, performed necropsies especially in relation to criminal cases and cases of suspected poisoning. Many of our colleagues engaged in general practice welcomed this help and in my opinion the time is now ripe for making such appointments in county areas.—I am, etc.,

Hove, Sept. 13th. JAMES ROBERT KAYE

SIR,—I have read with interest the correspondence on this subject, and agree with the opinions of Dr. Binns (September 13th, p. 449). Is the general practitioner going to abandon another branch of his profession? Many men on entering practice shirk surgery, fearing the responsibility, and after a time are afraid to incise an abscess. Midwifery, which thirty years ago was considered the backbone of general practice, is likewise given up and handed over to "homes" and midwives. Less and less dispensing appears to be done, I suppose, now that the chemist does the bulk of it (panel), it is thought not worth while to keep a dispensary, moreover, handing out tablets is so much simpler. In the above ways the practitioner loses many pounds every year, and, what is more to the point, loses his self-confidence. I always welcomed—and would still if the opportunity occurred—an order to make a post-mortem examination, it is an interesting change from the daily routine and teaches many things—self reliance among others. What if the surroundings are inconvenient? I have done an examination in a caravan by the light of one candle and the circumstances do not take away one's scientific interest.

G.P." (September 13th, p. 449) groans at a seven miles journey on a winter night—in a comfortable closed car, I presume perhaps with a chauffeur! He should try an open gig with carriage candles he might then have more reason for "writing home about it". I consider it will be most regrettable if the proposed abandonment of post-mortem examinations by general practitioners is carried out. By all means let us have mortuaries and necropsy rooms—a post-mortem examination in a private house is most unpleasant for the relations—but let us do our own work and face our responsibilities.—I am, etc.,

Plymouth, Sept. 13th. H. W. WEBBER

SIR,—As a young man with but seven years of general practice to speak from I view this correspondence with a little amusement and a greater apprehension. Apprehension because I am reminded of the only time in which I raised my voice (somewhat hesitatingly) at a meeting of the local Division of the British Medical Association, regretting the passing of midwifery from the hands of the G.P. I was then informed that I had only myself to blame, as in the distant past I had been unwilling to exert myself sufficiently to get up at night etc.

I venture to write because I feel that too often we younger men leave all this sort of thing to those "of thirty years' experience" and authors of pamphlets "in 1894". As a young rural G.P. I take it that the objections raised fall into three groups, and beg to comment on them in the light of my own experience.

1. A dislike for the performance of a rather unpleasant task under unsatisfactory conditions with inadequate instruments. *Ehen, fugaces*—and midwifery! As to the task and the conditions I, like Dr. Binns and I feel sure many others perhaps not yet old and sophisticated, welcome the experience and education afforded. As for the instruments, my experience is that these, like stethoscopes, thermometers, sphygmomanometers etc., are of our own providing. Perhaps the feelings of the relatives might here be considered, who look upon the whole thing as a most disgusting necessity which the law imposes on the bodies of their lost ones. They dislike it at their home but to remove the body to the mortuary would in many rural minds class it with unclaimed derelicts, and add yet more publicity to an unwanted procedure. There are in this area two mortuaries, in neither of them any instruments in one of them until a few months ago no hot water and I unhesitatingly prefer the farm kitchen table with plenty of newspaper, plenty of hot water and privacy to the gloom of the mortuary.

2. The inadequacy of the fee. This might with equal reason be argued about any of the daily duties of the rural G.P. In this case with one operation to be performed and one report written the fee compares handsomely with that received for emergency midwifery where operative risks are undertaken on two lives with the liability to visit any number of times during the following ten days.

3. Lack of skill and practice on the part of the G.P. Looking back—not very far—on the opportunities of student years I fail to see why this skill is less than that with which we launch out, armed with a stethoscope etc., and endeavour to make a diagnosis of any of the conditions of infants and children. If he is conscientious and willing I see no reason why any G.P. should face a post-mortem examination with any more apprehension than he faces any anxious mother who calls him in to see her child with a high temperature, wretched pulse, an obviously ill appearance and yet no diagnostic signs in chest or abdomen. Do we therefore at some future date propose to put such cases outside the domain of the G.P.? It almost looks like it. In the case of the post-mortem examination as in the case of any clinical problem the G.P., if in any serious doubt, has ample recourse to specialist advice without any implication of saving his face, or medico-legal humbug. As to practice my own experience of seven post-mortems in just over two years may have been fortunate but it compares favourably with my experience of small pox, bronchiectasis, pernicious anaemia and spinal myelitis, with which I am supposedly familiar and competent to deal.

To me the unsatisfactory thing is the total lack or need for and the complete uselessness of the majority of necropsies. Their sole purpose I take it is to protect the public against criminal deaths, they enable the coroner to issue a certificate of death from natural or accidental causes in the vast majority of cases a fact which is generally fully substantiated without the post-mortem examination. My own experience may be illustrative. Five necropsies were on elderly people—over 70 with one exception—who for years were known to have bad hearts, oedema of ankles and legs, breathlessness and failing health generally. They died trying to perform some task beyond their years and condition. There was no suspicion of domestic or financial trouble no reason for suspecting criminal operations of any kind but because they had not been seen by a doctor for weeks before the event off had to come their sternums off their cranial vaults, and nothing gained but a properly filled in report. The little amusement I find from the correspondence is in the vision it conjures up of motor pantechnicons racing from some vast headquarters carrying pathologists, loaded with retorts, Berzelius's tubes, microtomes, stains, and microscopes, a staff of laboratory assistants and expert chemists all careering to some farm labourer's cottage to examine the corpse of "granfer" who at the age of 89 has ceased to exist without the knowledge of the local G.P. I wonder what cause of death they would find?—I am, etc.,

Bideford, Sept. 13th. R. E. S. GIBSON, M.B., Ch.B.

TECHNIQUE OF RADIUM THERAPY

SIR,—I have used for twenty-five years, and still use, unscreened radium for the treatment of rodent ulcers of small size and when not involving bone I give a single dose, and place the radium at a distance from the surface equal to the diameter of the ulcer A marked reaction occurs in about ten days, followed by scabbing In six to eight weeks the cure is complete in almost all cases Recurrence is very rare The beta rays have certainly a very marked and valuable medicinal action —I am, etc,

Leeds, Sept 13th LEO A ROWDEN

TRANSECTION OF ULNAR OR MEDIAN NERVE

SIR,—I am anxious to see, for the purpose of some simple observations, a few cases of quite recent transection of the ulnar or median nerve, preferably lesions in the region of the elbow and of less than five days' standing, and I should be grateful to any of your readers in London who could place me in contact with such patients —I am, etc,

University College Hospital Medical School, W C 1 Sept. 13th THOMAS LEWIS

Obituary.

MICHAEL BEVERLEY, M D ED,

Consulting Surgeon, Norfolk and Norwich Hospital, Fellow of King's College, London

A VETERAN member of our profession, Dr Michael Beverley, consulting surgeon to the Norfolk and Norwich Hospital, died at Overstrand on August 31st He came of an old Norfolk family, and was for more than half a century prominent in the city and county, where he enjoyed a high reputation as a "general practitioner-consultant"

Michael Beverley was born at Brooke on September 26th, 1841, and on leaving school was indentured, as was then the custom, to a general practitioner, William Bransby Francis of Norwich Part of the apprentice's duty was to keep the surgery in good order, and there he learnt to make pills and compound medicines, he was initiated also into "the art and mystery of physic," visiting poor patients in the slum parishes of the city and in the neighbouring country districts Small-pox and typhoid were very prevalent at that time, and young Beverley took notes of many cases attended by him He then acted as dresser and clinical clerk at the Norfolk and Norwich Hospital, and continued his studies in London at King's College Hospital under Sir William Ferguson, and in Edinburgh, where he "dressed" for Syme and "clerked" for Sir James Simpson After graduating M D Ed in 1863 he spent a year in Paris, attending daily the Hôtel-Dieu and other hospitals News of a vacancy in the house-surgeoncy at the Norfolk and Norwich Hospital led him to become a candidate, and he entered on his duties at the end of 1864, thus beginning an official connexion with the hospital which lasted until 1912 After acting as resident medical officer for six years he went to Dublin to brush up his midwifery, and thence, in 1871, to Edinburgh, with an introduction from his friend William Cadge to Lister, who invited him to be present at his operations and follow up the subsequent treatment of surgical cases in hospital and private practice Beverley returned to Norwich full of enthusiasm and ready to carry out the then Listerian system He often recalled in later years the first time the antiseptic method was tried by Mr Cadge and himself in the operating theatre of the Norfolk and Norwich Hospital It proved a great success, although surgeon and patient had cause to remember the irritating effects of the carbolic spray Beverley was present at Lister's introductory address at King's College, and kept in touch with "The Master" up to the last Speaking at a public presentation at the time of his retirement he said "Whatever success I have had in life I attribute in the main to my early and subsequent connexion with the Norfolk and Norwich Hospital Mr work there during a long series of years not only grounded me with practical experience in all forms of accident and disease, but it brought me in touch with my professional brethren, amongst whom I made many and lasting friendships It gave me the privilege of taking pupils, of whom I once had six, and finally it led to my partnership with the late Mr Cadge" Professor Ernest W White, who was a resident pupil at the hospital in 1868, recalls that Dr Beverley was a first-class botanist, and would take his students out for walks in search of wild flowers before breakfast in the summer months, he was also one of the founders of the Norfolk and Norwich Naturalists' Society "He was a thorough master of his profession, and both willing and anxious at all times to impart his knowledge in an impressionable manner, and his kindly sympathetic nature endeared him to us all and laid the foundation of lifelong friendships Those who survive him will ever revere his memory"

For many years Dr Beverley was intimately concerned in the work of the British Medical Association, which he had joined in 1870, and acted as honorary local general secretary for the Annual Meeting at Norwich in 1874 He was elected to the Central Council in 1893 as a representative of the East Anglian Branch, and served continuously until 1906 He frequently took part in debates, and was a diligent member of several committees After twenty years' service as honorary secretary of the East Anglian Branch he held office as president in 1890-91, and for the following twelve years was a vice-president He was also for some years a member of the council of the Medical Defence Union

Dr Beverley was the senior magistrate of Norwich, his appointment dating as far back as 1875, and after his election to the consulting staff of the Norfolk and Norwich Hospital he served as vice-chairman and chairman of the board of management He was always delighted to talk of Sir Thomas Browne, and proud to call himself a fellow citizen of the author of *Religio Medici*

The funeral service was held on September 3rd in Norwich Cathedral, in the presence of a large and representative congregation, including Mr A J Blaxland, president of the Norfolk Branch of the British Medical Association, Dr George Day, honorary secretary of the Norwich Division, and many other leading members of the local medical profession

LEONARD PORTAL MARK, M D

LEONARD MARK was born on February 4th, 1855, the son of Edward Walhouse Mark, who became consul at Marseilles in 1858, and grandson of William Mark, who had been consul at Malaga Leonard Mark was educated at the Lycée Imperial at Marseilles, with 1,200 other boys, from October, 1866, to 1870, and under the guidance of his father (who entered Rugby under Dr Arnold in 1830) he learnt to swim, fence, and walk in a manner admired by his fellow students but not copied by them At the age of 18 he entered his father's office, but, the work proving uncongenial, he came to London and entered St Bartholomew's Hospital in October, 1875, the choice of hospital being determined by the fact that Dr Patrick Black, who had married in 1843 his aunt—Miss Mark—was then the senior physician Mark qualified M R C S Eng in 1879, but did not take the L R C P Lond or the L S A until 1881, nor the M D Durh until 1899 He served as assistant house-surgeon at the Sussex County Hospital, Brighton, house-surgeon at the Richmond Hospital, Surrey, house-physician at the Lying-in Hospital in York Road, Southwark, and resident clinical assistant at the Bethlem Hospital He then made a voyage to Australia, and for a time thought of practising in Calcutta Eventually he settled in London, first at Beulah Hill, Sydenham, and, finally, at 49, Oxford Terrace, where he was in partnership with Mr Henry Cripps Lawrence after the death of Mr C H Cosens He was at this time an active member of the profession who took a prominent part in the work of the Harveian Society, and was honorary secretary of the West London Medico-Chirurgical Society

Coming of an artistic family, and being already known for his skill in water colours, he was invited to act as pathological artist at St Bartholomew's Hospital upon the resignation of Mr T Godart, who had filled the post for many years Mark accepted, and attended on certain specified afternoons, although he was immediately available if a case was found unexpectedly in the wards, the

out patient room, or the post-mortem room. The collection of drawings in the hospital museum contains many examples of his skill. At this time and for several years previously he had suffered from the disease now known as acromegaly and in 1912 he published *Acromegaly: A Personal Experience*. The work is of interest and value because it traces the course of the insidious disease which wrecked his life, from the appearance of the first symptoms, through its full development, to the time when it began to fail, or at least to become stationary. Fifteen years later he wrote a supplement entitled *The Apologia of an Acromegalic*. Neither account is in any way morbid or introspective, for he took a detached view of his case and recorded the various symptoms as he would have done had they occurred in one of his own patients. The account is rendered the more valuable because it is illustrated with photographs from the age of 4 to 57 years. It is remarkable that, in spite of the enlargement of his hands and feet and the intensity of the headaches the fact that he was suffering from acromegaly only became known to him as if by a sudden intuition about forty-five years after the onset. He then discovered that it had long been known to his medical friends, and even to some members of his own family.

Leonard Mark died having never married on September 5th at 49, Oxford Terrace aged 75. In a true scientific spirit he directed that an examination of his brain and skull should be made by a skilled pathologist. He also left a detailed diary which should be of value in still further elucidating his symptoms. Although Mark's life was crippled and spoilt by disease he was not nor would he like to have been thought, a martyr. So long as it was possible he went about his daily work quietly without repining, and when he was no longer able to leave his house he welcomed his friends with the courtesy of an English gentleman bred in France. His knowledge of French, both colloquial and written, was complete and was usually called upon at the various medical international congresses and at gatherings to promote the entente cordiale. He was often asked to give an opinion upon questions of antiquarian medical art and his decision was always considered final. He was a lover of Montaigne and wrote a pleasant account of the great essayist's travels which he was able to elucidate from personal knowledge.

Dr F R B ATKINSON writes:

Although I did not know the late Dr Leonard Mark so well as many others I should like to say a few words of tribute to his memory. Always interested in his malady he was ever ready to hear anything concerning it found in the literature and it was not long since I told him he was the oldest case recorded as far as I knew. Ever suffering great discomfort during the fifty years of his illness often in extreme pain, he never gave in. The last time I saw him he was deaf, nearly blind, could hardly walk and was suffering from various complications connected with his disease. To show what manner of man he was I cannot do better than quote the words he uttered to me not so long since: "I have much to be thankful for." The medical profession is honoured by such a one.

THE LATE DR CHARLES BUTTAR

DR W CRAIG WILKINSON writes:

It is fitting that I should bear testimony to the truth of your obituary notice of an old friend who has recently been engaged in investigating scientific methods of dealing with tuberculosis among the poorer classes. I sympathized with Dr Buttar's energetic crusade to prevent the general practitioner among the poorer classes being brought under the control of a Government bureaucracy, and my old friend Sir Dawson Williams brought Dr Buttar within the ambit of my work.

Dr Buttar was a man of keen intellect and high character. He had a logical mind and soon found any weak spot in the armour of those who magnified the importance of ideas based mainly on authority or custom. He was a patient eager searcher after truth and friends and opponents alike will remember his bright eyes sparkling with energy as he proceeded to apply his own knowledge and critical faculty to any difficult problem with unerring logic and telling emphasis—and yet without any unworthy motive or personal bias. Recently I have had many opportunities of observing his keen power of analysis, despite his ill health, and in his death medicine has lost a noble and loyal exponent of its highest ideals. His death is both a personal and a public loss. I trust that it will be proved that even in the throes of his last sickness his courage has enabled him to render a useful public service in attempting to sift the wheat from the chaff in the vexed question of the value of Koch's scientific method of dealing with the problem of tuberculosis among the poorer classes of society.

Dr W H REES THOMAS of Basingstoke who died on August 9th at the age of 60 was educated at the London Hospital Medical College and in Brussels. He obtained the diplomas M R C S, L R C P in 1893 and two years later graduated M D Brux. He held the posts of medical officer of health for the borough of Basingstoke medical officer of health and public vaccinator of the Basingstoke Union medical superintendent of the Basingstoke Isolation Hospital and surgeon to the Basingstoke Cottage Hospital. Dr Rees-Thomas was a member of the British Medical Association.

We regret to record the death at the age of 49 of FREDERICK LIVINGSTONE TULLOCH, M B, Ch B, which took place at Aberdeen on August 10th. After graduating at Edinburgh University in 1911 Dr Tulloch served as house-physician to several hospitals in England, and at the outbreak of war was in general practice in Birmingham. Being in the Army Medical Reserve he was drafted to France in September 1914 and served there during the whole period of the war. On his return to civil life he entered into partnership in general practice at Nuneaton where he became first honorary radiologist to Nuneaton General Hospital, visiting medical officer to Bramcote Sanatorium and medical referee under the Ministry of Pensions and took an active part in the work of the Nuneaton Branch of the St John Ambulance Association. Dr Tulloch was not only exceptionally well versed in the essentials of medicine but was one of those lovable men who always interested themselves in the welfare of others. He endeared himself to his patients and was very popular among the young men of the district entering actively into their recreations. About five years ago he had an attack of pneumonia from which he never completely recovered. In his infirmity he showed the fortitude that is seen only in those who possess stability of character in an exceptional degree. He leaves a widow and young son.

Dr JOHN ARGENT BALL who died at Oxford on August 23rd in his eighty-eighth year, had been associated with Stockport Infirmary for sixty-three years and at the time of his death was senior consulting surgeon to that institution. He received his medical education at Guy's Hospital where he later held the posts of house-surgeon and obstetrical resident. Having obtained the diploma M R C S in 1855, and graduated M B Lond. in the following year, he was appointed the first resident house-surgeon at Stockport Infirmary in 1867. Two years later he commenced general practice in that town being elected honorary surgeon and chairman of the medical board of the Infirmary and consulting surgeon eighteen years later. In 1869 he went to Heaton Norris. A keen member of the British Medical Association he was elected President of the Lancashire and Cheshire Branch in 1887 and a banquet attended by many celebrated men including Sir Andrew Clark was given at Old Trafford in his honour. In the same year he moved to Wantage becoming later a vice-president of the Oxford Branch but retaining at the special request of the governors of Stockport Infirmary, his appointment there of consulting surgeon. He went to

Bromsgrove in 1894, and soon built up a large practice, finding congenial surgical work at the local cottage hospital. Dr Ball was twice married, after his second marriage in 1902 he took charge of his stepfather's practice at Stradbroke, Suffolk. He retired in 1913, and went to live in Warwickshire, but on the outbreak of war resumed practice, acting as locumtenent for medical men engaged in military service. Soon after the end of the war he settled finally in Oxford. Dr Ball was an outstanding figure in the medical and social life of every town in which he practised. He was a strong Churchman, a sympathetic and loyal colleague, and a skilled and devoted general practitioner.

Dr G. W. R. SKENE, who died on September 2nd at the age of 54, was a prominent figure in Willesden. He received his medical education in Edinburgh, where he obtained the diplomas L.R.C.P., L.R.C.S.Ed., and L.R.F.P.S.Glas. in 1901, and graduated M.B., Ch.B. in 1903; he proceeded M.D. seven years later. After a short residence in Stoke Newington he went to Kensal Rise twenty-five years ago, and built up a considerable practice. He rendered great service as medical officer to Willesden General Hospital, and was for twelve years a member of the council of that institution, he had recently been elected vice-chairman. He latterly associated himself actively with the work of the Willesden Nursing Association. He became a member of the Willesden District Council in 1921, and five years later was appointed its chairman. He took a leading part in the erection of Brondesbury Park Congregational Church, and was for many years superintendent of the Sunday school. The Rotary movement received his support and he was largely instrumental in founding the East Willesden Club, of which he was the first president. He was a member of the British Medical Association, and was chairman of the Willesden Division from 1922 to 1923. He married twice, and is survived by a widow, a daughter, and two sons, one of whom is in the medical profession.

Dr JOHN COCKCROFT of Middleham, Yorks, died on September 7th at the great age of 92. He began his medical studies at Owens College, Manchester, and continued them at St. Andrews, obtaining the M.R.C.S.Eng. and L.S.A. diplomas in 1860, and graduating M.D.St. Andrews in the following year. Soon afterwards he began practice at Middleham in partnership with three other members of his family. The partners visited their patients on horseback, making long journeys to hamlets scattered among the moors and dales of North-west Yorkshire, and travelling as far afield as Garsdale, Kettlewell, and Pateley Bridge. The partnership was dissolved many years ago, and Dr. John Cockcroft thereafter continued the work single-handed. According to an obituary notice in the *Harrogate Advertiser*, to which we owe these particulars, there were few families in Wensleydale who had not called upon Dr. Cockcroft's services during his seventy years of active practice. Among his many reminiscences was a bad epidemic of typhoid fever at Thornton Steward in 1870, when he sent out medicine in clothes baskets to this little village. Dr. Cockcroft had a wonderful physique, and retained full possession of his faculties until two and a half years ago, when he had a stroke. His death removes one of those hardy self-reliant Yorkshire doctors of the old school whom Sir Clifford Allbutt came to know so well and esteem so highly during the days of his consulting practice in the West Riding.

The death has taken place at the residence of his mother, 440, King Street, Aberdeen, of Dr ALEXANDER HUTCHISON of Buckley, Chester. Dr. Hutchison graduated in arts at Aberdeen University in 1899, and in medicine in 1904. He was in practice at Grantown-on-Spey from 1906 to 1924, and was well known and highly esteemed on Speyside. Latterly he had been in practice at Buckley, near Chester. He had not been in good health for some time, and went to Aberdeen to recuperate.

The Services

DEATHS IN THE SERVICES

Lieut.-Colonel Sidney Browning Smith, C.M.G., Bengal Medical Service (ret.), died after a long illness at Otford, Kent, on July 15th, aged 63. He was born on November 12th, 1866, the son of Dr. Thomas Browning Smith of Sittingbourne, Kent, was educated at Epsom College and at St. Bartholomew's Hospital, and took the M.R.C.S. and L.R.C.P. Lond. in 1889, subsequently the D.P.H. of the London Colleges in 1910. Entering the Indian Medical Service as surgeon on July 28th, 1891, one of the last term who entered Netley under that title, before the grant of compound titles, he became lieutenant-colonel after twenty years' service, was placed on the selected list for promotion on June 24th, 1918, and retired on November 12th, 1921. When at Netley he gained the Parkes Memorial Medal for Hygiene. He served in the Chitral campaign of 1895 in the actions of Chakalwat and Nisa Ghol, was mentioned in dispatch No. 8 c. of July 26th, 1895, and received the frontier medal with a clasp; he contributed some drawings to Younghusband's *Relief of Chitral*. He also served in the Waziristan campaign of 1901–2. He then entered civil employ in the Punjab, was posted as district plague medical officer at Amritsar in 1902–3, and was chief plague medical officer in the Punjab from 1903 to 1912. He was recalled to military duty on the outbreak of war in 1914, accompanied the Indian Expeditionary Force to Europe, and first served in charge of the Mont Dore Hospital for Indian troops at Bournemouth and subsequently in Egypt; was mentioned in dispatches in the *London Gazette* of July 27th, 1917, and received the C.M.G. on June 4th, 1917. On his retirement he married Lady Edith Rattigan.

Medical News.

THE opening ceremony of the ninety-sixth winter session of the Middlesex Hospital Medical School will be held at the Queen's Hall, Langham Place, on Wednesday, October 1st, at 3 o'clock. Mr. Eric Pearce Gould will deliver the introductory address, and the Rt. Hon. Arthur Greenwood, M.P., Minister of Health, will preside and distribute the prizes gained during the past year. The wards of the new west wing, the new nurses' home, the medical school, and research departments will be open for inspection. The annual dinner will be held at the Savoy Hotel (Embankment entrance) on Wednesday, October 1st, at 7.30 p.m.

THE annual prize giving at St. George's Hospital Medical School will take place in the board room of the hospital at 3 p.m. on Wednesday, October 1st, when an address will be given by Lord Riddell on "Some things that matter for doctors, from a lay man's point of view." The annual dinner will be held the same evening at the Hyde Park Hotel at 7.30 o'clock, with Dr. James Collier in the chair.

AT the opening of the new session of the Pharmaceutical Society's School of Pharmacy on October 1st, at 3 p.m., the inaugural address will be given by Dr. Arthur W. Hill, F.R.S., Director of the Royal Botanic Gardens, Kew.

THE Harben Lectures for 1930 will be delivered at the Royal Institute of Public Health (37, Russell Square, W.C.1) by Professor William H. Park, director of the Bureau of Laboratories, Health Department, New York City. His subject is "Pneumonia," and the lectures will be given at 4 p.m. as follows: October 6th, "Types of pneumococci in adults and children and their significance"; October 7th, "Epidemiology. The refining of antipneumococcus serum"; October 8th, "Therapeutic use of vaccines and antibacterial sera." No ticket of admission is required.

A COURSE of nine lectures and demonstrations in tropical hygiene and nursing will be given on Wednesdays, at 8 p.m., at 27, Grosvenor Place, commencing on October 1st. The course, which will cover such questions as food, clothing, and the medical and sanitary precautions necessary for health in hot countries, will be conducted by a medical man and a nurse, both of whom have had practical experience of life in the Tropics. Inquiries should be addressed to the county secretary, County of London Branch, British Red Cross Society, 27, Grosvenor Place, S.W.1.

THE next course of lectures and demonstrations in tropical hygiene, for men and women outside the medical profession proceeding to the Tropics, will be given by Lieut.-Colonel G. E. F. Stammers, on October 8th–10th, and 13th–17th, from 11 a.m. to 12.30 p.m. The fee for the course is one guinea. The synopsis can be obtained on application to the secretary, London School of Hygiene and [illegible] Street, W.C.1.

A THREE months course of lectures and demonstrations on clinical practice and in hospital administration for the D P H will be given at the North Eastern Hospital, St Ann's Road Tottenham, N 15, by Dr F H Thomson on Mondays and Wednesdays at 4 45 p m , and alternate Saturdays at 11 a m , beginning October 1st Medical men desiring to attend the course are required to pay the requisite fee (£4 4s under new regulations or £3 3s under old regulations) to the Medical Officer of Health, London County Council Public Health Department (Special Hospitals) Victoria Embankment E C 4, giving their full name and address

THE Fellowship of Medicine announces that from September 29th to October 11th there will be a special post graduate course in medicine and surgery and the special departments at the Metropolitan Hospital Kingsland Road E 8 from 10 30 a.m to 5.30 p m each day, with special demonstrations in the morning attendance at the surgical medical, or special departments in the afternoon, and ending with a formal lecture at 4.30 p m There will also be daily pathological demonstrations Luncheon and tea are obtainable at the hospital at a small charge Special courses in October will deal with the following subjects diseases of the ear nose and throat October 6 h to November 1st tropical medicine, October 6th to 25th (all day) Gynaecology, October 13 h to 24th, diseases of children, October 27th to November 5th and orthopaedics October 27th to November 5th There will also be evening courses in preparation for the M.R.C P examination (17 lectures on Tuesdays and Fridays), and for the F R.C S (final) examination 16 demonstrations on Wednesdays) Further particulars and syllabuses of all courses may be obtained from the secretary of the Fellowship 1 Wimpole Street, W 1

A POST-GRADUATE course in genito-urinary diseases, free to medical practitioners and students will be given at St Paul's Hospital, Endell Street W C.2 on Wednesdays at 4 30 p m , from October 1st to December 10 h Tea at 4 o clock

UNDER the auspices of the National Council for Mental Hygiene a series of lecture discussions will be delivered on Thursdays at 5 15 p m from October 16th to November 27th, in the lecture room of the Medical Society of London 11 Chandos Street Cavendish Square W 1 Dr G W B James will open the series with a lecture entitled A physician looks at history The second on preventive treatment in childhood will be given by Dr Alice Hutchison and the third on alcoholism and drug addiction by Dr Edward Mapother Mental conflict and the development of character will be subsequently discussed by Professor William Brown, and the psychology of adolescence by Dr Doris S Odlum The concluding lecture will be delivered by Dr R G Gordon and will deal with the importance of mental deficiency Tickets (price 1s 6d each or 7s 6d for the course) may be obtained from the secretary of the National Council 78 Chandos House Palmer Street S W 1 or at the door It is also announced that the second Mental Health Conference organized by the National Council, will be held in May 1931.

THE British Science Guild announces that the sixth annual Norman Lockyer Lecture will be delivered by Professor Sir William Pope F R S , on Thursday November 13th at 4 30 p m in the Goldsmiths Hall London the President of the Guild, Sir Samuel Hoare will take the chair at the lecture, the title of which will be announced later The second annual Alexander Pedler Lecture will be given by Lieut Colonel Sir David Prain F R S in Liverpool on Wednesday October 22nd at 5.30 p m The lecture will deal with Science Discipline and its delivery will be under the joint auspices of the University of Liverpool and the Guild

A POST-GRADUATE course, open to all medical practitioners without fee will be held in the library of the Medical School of St Mary's Hospital on the three days October 3rd to 5th Subjects to be dealt with include the after treatment of some common operations coronary thrombosis and cardiac pain some minor common digestive disorders nephritis diagnosis of breast tumours causes and treatment of vaginal discharge and irregular uterine haemorrhage refusal of food by children the management of septic infections, and the restoration of septic fingers and hands to normal function the surgical uses of radium and the treatment of diabetes Further information may be obtained from Dr C M Wilson dean of the Medical School St Mary's Hospital Paddington W 2

AT a meeting of the Royal Sanitary Institute to be held on Friday, October 10th in the Guildhall Nottingham discussions will take place on river pollution and on industrial medicine in relation to public health The chair will be taken at 4 30 p m by Dr Charles Porter

THE thirty sixth Congress of the Italian Society of Internal Medicine will be held in Rome from October 13th to 16th, when the following subjects will be discussed pneumonia oedema introduced by Professor C Frugoni diagnosis between visceral neuroses and organic disease, introduced by Professor P Castellino and the diagnosis and treatment of haematuria introduced by Professor A Ferrata Further information can be obtained from the secretary, R Clinica Medica Rome

THE Italian Society of Colonial Medicine and Hygiene will hold its third congress at Tripoli from October 3rd to 8th, when the subjects for discussion will be framboesia or pian African relapsing fever, dengue, and animal trypanosomiasis

THE first congress of the French Society of Plastic Surgery will be held in Paris on October 3rd and 4th under the presidency of Professor Dartigues There will be an exhibition of surgical instruments models, skiagrams and photographs Further information can be obtained from the secretary, Rue d Arian 41 Bordeaux

DR M I FITZCANE who since 1913 has been surgeon and medical officer to the A Division Metropolitan Police was presented on September 10th with a silver cigar and cigarette box subscribed for by the officers and men of the division The presentation was made by Chief Constable Brigadier James Whitehead in the presence of a very large gathering

THE September issue of *Acta Rheumatologica* the official journal of the International League against Rheumatism contains an account of the recent congress of the league held at Liege The principal subject for discussion was the disturbance in the skin circulation in rheumatic diseases, in which the following members took part Jens Foyed of Copenhagen J van Breemen of Amsterdam Gunnan Kuhl meter of Stockholm Lajpnel Lavastine of Paris, and Ralph Pemberton of Philadelphia

THE Water Pollution Research Board of the Department of Scientific and Industrial Research has issued a further series of abstracts of current literature in 1928 to 1929 dealing with water supplies the analysis and examination of natural waters sewage and trade waste waters pollution of natural waters and various miscellaneous subjects This booklet may be consulted in the library of the British Medical Association

DR RUDOLF KRAUS of Vienna has been appointed director-general of public health in Chili

QUERIES AND ANSWERS.

INHERITANCE OF MENTAL DISORDER.

"AFFLECK" writes A mother has been to see me recently with the following query She has one child 5 years old who is mentally abnormal but otherwise healthy A maternal uncle is confined in a mental hospital the maternal grandmother died there and it is said to be recovered All other relatives are normal What are the chances of another child which the parents are anxious to have being normal in mind and if normal what is the outlook for the generation to follow? I have in the meantime advised against pregnancy but would like the opinion of other medical men about the inheritance of mental abnormality

WRITER'S CRAMP

DR W BLACK JONES (Creigiau, Cardiff) writes: In reply to "Devon" (September 13th, p. 455), I suggest that treatment by electrolysis would be very beneficial, the methods are described in a paper which I published in the *British Medical Journal* of January 17th, 1925, entitled "Treatment of neuritis by electrolysis." Some years ago I suffered from this complaint, and the treatment has been quite successful.

"E. A. B." (London, W.1) writes: This condition should be regarded as a neurosis. Relief will almost certainly follow appropriate psychotherapeutic treatment.

SOUR MILK

DR H. M. SUTTON (Medstead, Hants) writes: Among the various methods of making sour milk mentioned by your correspondents I have not observed any reference to the very simple method in use in Germany. Fresh unboiled milk is put into a bowl or pie dish or any such open vessel, without the addition to it of anything, whatsoever. The vessel is placed in the larder in warm weather, or in the kitchen in cold weather, and after standing untouched for thirty-six to forty-eight hours it is ready for use, having the appearance of junket and a very pleasant, slightly acid flavour. It may be eaten alone, or, as is usual in Germany, with a mixture of powdered cinnamon and sugar sprinkled over it. We have used this method in our house for forty-five years, and have found none other so simple and easy and none to give better results, after having lived amongst and tried the methods of many nations.

WHITE SPOTS ON FINGER NAILS

DR G. W. FILMING (Todmorden) writes in reply to "R. L.'s inquiry (September 15th, p. 455): I believe from observation of my own nails that these white spots are entirely due to injury to the quick of the nail (the white crescentic part) in pushing back the cuticle. If this is done gently with as little pressure on the quick of the nail as possible, no further spots should appear.

DR F. DOUGLAS MARSH (Edgbaston, Birmingham) writes: White spots on the finger nails are scars. They are caused by injury to the base of the nail fold usually inflicted by pressing back the cuticle when it is dry. If the cuticle is dealt with only when soft and moist, the white spots will cease to be formed.

"E. J. P." writes: These spots can be caused by excessive zeal in manicuring, through bruising the nail bed with a sharp instrument. Let the patient use only a rubber "hoof" to push back the cuticle, but warn her that some spots have yet to appear from damage already inflicted.

"D. Y." writes: In my experience persons showing white spots on finger nails are invariably of a very nervous temperament, and frequently suffer from definite psychoneurotic symptoms.

ANHIDROSIS AND ABSCESS

DR A. KENDREW (Ticehurst, Sussex) writes: In reply to Dr. R. Johnston McNab (September 13th, p. 456), who describes two cases of axillary adenitis following the use of a toilet preparation, it may be of interest to record a case of mine now under treatment for axillary adenitis and abscess, due to the use of one of the proprietary depilatories. There was no pyrexia.

DR SPENCER CHURCHILL (Ryde, I.W.) writes: In reply to Dr. Johnston McNab's inquiry, I have had a similar experience. A maid in a boarding house applied a toilet preparation to her axillæ for the purpose of removing hair. She made only one application, which was followed immediately by smarting and pain. A week later I was asked to see the patient (a plump brunette) because she was prevented from sleeping by pain in the right axilla. On examination she presented the signs of acute cellulitis of the right axilla. On the ninth day after the application of the irritant I incised an abscess and evacuated about 1/2 oz. of pus. One of the patrons of the boarding house declared that she had used the same toilet preparation without harm.

1 LB. AT BIRTH

DR E. H. HEATON (Clacton-on-Sea) writes: I do not know what is the smallest living baby recorded, but think the following might be worth reporting. 6 months' baby, male, weight 1 lb., was living and survived for 57 hours.

*** In the *Journal* of November 10th, 1928, Dr. W. L. Hubbard recorded the survival of a child whose weight at birth was 15 oz. and on December 8th, 1928, Dr. Herbert Shackleton recorded that of a child weighing 17 oz.

INCOME TAX

Cash Basis

"T. B. E." has been assessed on the cash basis in the past, but has now been asked to state the total amount of debts outstanding at the end of the year.

*** It would be obviously wrong to include these outstanding debts without deducting the amount outstanding at the beginning of the year. That combined adjustment would have the effect of converting the 'cash basis' to a "bookings basis," and is justifiable if there has been any appreciable change in the volume of the work done, otherwise, the result of the two methods should be substantially the same, and there is no necessity to discard the more convenient "cash basis." It should be remembered that in making the conversion mentioned above, an allowance should be claimed for bad debts—that is, the probable losses should be carefully computed and deducted from the gross totals at the commencement and the end of the year. It is largely in the avoidance of these troublesome estimates that the advantage of the cash basis lies.

LETTERS, NOTES, ETC.

INTERNATIONAL ORAL HYGIENE EXHIBITION

WE have received the following communication from Mr. A. E. ROWLETT (165, London Road, Leicester) and Mr. I. MENZIES CAMPBELL (14, Buckingham Terrace, Glasgow, W.2), who are acting as joint organizers for the British Section of the Oral Hygiene Exhibition, Eighth International Dental Congress:

It was unanimously decided by the Hygiene Commission of the Federation Dentaire Internationale during the recent session held at Brussels that an International Oral Hygiene Exhibition should form part of the Eighth International Dental Congress at Paris from August 3rd to 8th, 1931. The organizing of this exhibition was delegated to a committee, comprising representatives chosen from all countries affiliated to the Federation Dentaire Internationale. In this way its international character is assured. As it is most desirable that Great Britain should be adequately represented we should be glad if those who are in a position to assist with suitable exhibits relating to all branches of oral hygiene, including the teeth of children of all ages as well as those of adults and the care of the expectant mother, would forward to either of the above full particulars of any exhibits which they may be prepared to loan. This should be done as soon as possible, because the organizers of the Hygiene Exhibition will require to know before the beginning of December the exact space to allot to each country. It is particularly requested that our colleagues will assist in making the British Section of the exhibition eminently successful.

SPECIALISM IN RADIUM SURGERY

DR A. CAMPBELL (Perthshire) writes: I shall be glad if Mr. Duncan Fitzwilliams would enlighten us on the following matters. (1) Who are the people referred to in his paper on the technique of radium therapy (*British Medical Journal*, August 30th, p. 309) as "trained and capable" of using radium? (2) How is one to know who may rightly be described as a specialist in radium surgery? (3) Are the institutions to blame if it is indeed a fact that "radium treatment in this country has survived in spite of ... institutions which have loaned radium to people entirely ignorant of the subject"? Should they have left the radium in charge of a surgeon—that is, an F.R.C.S.—or a radiologist—that is, one who holds a D.R.M.E.—or should the appropriate specialist have had both degrees? I do not think that radiology is an optional subject for an F.R.C.S. examination, as it is for the M.R.C.P. Ed. How, then, is a hospital board to be guided? It seems plain to me that "radium surgery" should be in the hands of radiologists who are capable surgeons, and that radiology should be made a special subject for F.R.C.S. examinations.

PREGNANCY AND CERTIFICATION

"H. R." writes: I think it is time that a committee was appointed jointly by the British Medical Association and the Ministry of Health to lay down rules for the guidance of national health insurance practitioners in certifying pregnancy. I suggest this as much for our own protection as for the benefit of the patient. Guided by our regional medical officer, my habit has been to "sign the patient on" five weeks before the expected date. My experience has been that patients come up between four and a half and six months and ask to be signed on the panel. They want to get "something out of the panel"—an investment to be repaid a thousandfold. I am sure that most of them who are signed on do heavy manual work in the house all the time. When I decline to sign them on, as I do in uncomplicated cases until the last five weeks, I am told that Dr. X. or Dr. Y. signs patients on without any fuss at the sixth month or earlier, and, what is more, allows a few weeks after the confinement. In one case I was told that for weeks one doctor was giving wool, lysol, sheeting, etc., in preparation for the confinement. Very often the patients are urged to this attitude by unscrupulous insurance agents, who seek thus to curry favour and effect private insurances. Some of my patients have transferred because of my refusal to sign them on at six months. Those who have stayed have been discontented. I suggest there should be definite times for signing on uncomplicated cases, thus, for example, light manual workers, eight months, heavy manual workers, seven months, and that no certification should be accepted on other times. This would put a stop to an undesirable situation, and to public accusation of liberal certification.

VACANCIES

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 43, 44, 45, 46, 47, 51, and 52 of our advertisement columns, and advertisements as to partnerships, assistantships, and locumtenencies at pages 48, 49, and 50.

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page *143*.

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine.

258. Immunization against Diphtheria.

S SCHMIDT (*Ugeskrift for Laeger*, June 25th 1930, p 634), of the State Serum Institute in Copenhagen, prefaces his account of his own investigations with a short review of the work of Löwenstein, who attempted to induce active immunity to diphtheria by rubbing into the skin an ointment containing diphtheria toxoid and diphtheria bacilli Schmidt notes that various clinicians have employed this preparation on human beings, who have subsequently It is claimed shown themselves to be immune during epidemics of diphtheria As it is obvious that this procedure if it is effective, possesses considerable advantages over the system of injections hitherto practised, Schmidt has submitted Lowenstein s claims to tests on guinea pigs using that author s preparation in some cases and two preparations from the laboratory of the Serum Institute in other cases. Löwenstein s ointment was rubbed into the shaved skin of 25 guinea pigs, a fatal dose of diphtheria poison being injected three weeks after the beginning of this treatment twenty four other guinea pigs were tested with the preparations of the Serum Institute Only in one case was there evidence to suggest that immunity of any value could be achieved by this process and in no case could a degree of immunity be reached, such as that which treatment by injections provides

259 V BIE (ibid p 635) contrasts the diphtheria records among nurses in his fever hospital according as they were or were not artificially immunized against this disease In the period 1924–28, the incidence of diphtheria among the probationers was so high that approximately every ninth probationer contracted it Since October 1st, 1929, Bie has vaccinated every probationer joining the staff of his hospital, whether she gave a positive or a negative reaction to Schick s test Burroughs Wellcome s toxoid antitoxin was used, the dosage of the injections being 0 5, 1, and 1 c cm , and later 0.5, 1 and 1.5 c cm An interval of two weeks was allowed between each injection Between October 1st, 1929, and March 1st, 1930, eighty-eight probationers were thus immunized, in the period October 1st, 1929 to May 31st 1930 only one of these developed diphtheria, which ran a light course the duration of illness and convalescence being only thirteen days For the sake of comparison Bie has collected the records of the probationers joining the staff of his hospital between October 1st 1928, and May 31st 1929 These controls had not been artificially immunized and twenty one of them developed diphtheria, the total number of their days of illness and convalescence being 655 After discussing various objections which might be raised to his statistical comparison and dismissing them as inadequately pertinent, Bie concludes that the practical cessation of diphtheria among probationers in his fever hospital must primarily be traced to their artificial immunization

260 Low Blood Pressure.

E N CHAMBERLAIN (*Liverpool Med Chir Journ*, 1930 Part II, p 235) discussing low blood pressure, considers that anything below 110 should be regarded as hypotension though he points out that such a definition is arbitrary since a patient with a normal pressure of 140 might be regarded as suffering from low blood pressure if this suddenly fell to 110 which might be the normal in another patient Examination of a number of apparently normal students showed that a considerable percentage fifteen out of sixty were the subjects of hypotension The pathology of postural and essential hypotension is considered, as well as that due to shock and haemorrhage, the latter being caused by rapid reduction in the blood volume combined with the loss of colloids from the blood In both acute and chronic bacterial infections the blood pressure is low, and its study may afford reliable information as to the progress of the disease Pneumonia, diphtheria, scarlet and rheumatic fevers and notably in influenza are associated with hypotension the persistence of which for some considerable time in the latter accounts for the asthenia and depression accompanying convalescence, either directly, or due to some common cause Hypotension in the chronic infections is seen in syphilis and tuberculosis, and most constantly in the latter In the cardiovascular diseases hypotension is found least often except as a terminal event Some cases require no treatment and in others it is unavailing It is necessary for some patients when it is one of several symptoms requiring attention, or is urgent as in shock or haemorrhage The treatment of hypotension in the infectious is essentially that of the disease itself particularly when a specific remedy is available, as in diphtheria. Of the endocrine disorders associated with hypotension Addison s disease is the most important, though notoriously resistant to treatment, the administration of whole suprarenal gland extract with subcutaneous injections of adrenaline has proved useful in some cases

261 An Epidemic of B paratyphoid C Infection

R. LEWILLON (*Bruxelles Méd*, June 1st 1930 p 841) records an epidemic of 41 cases of *B paratyphosus* C infection which occurred among native troops at Katanga (Belgian Congo) at the end of 1928 The characteristic feature of this disease being septicaemia the anatomical lesions were not very marked In 20 necropsies hypertrophy of Peyer's patches was found in only 3, and in 3 other cases there was congestion or ulceration of the large intestine On the other hand, splenomegaly was present in 14 cases, and enlargement of the liver and jaundice was very frequent Congestion of the pulmonary bases was evident in several cases In the meningeal forms the cerebro-spinal fluid was under tension, it was clear and contained an excess of albumin but no polynucleosis Treatment was chiefly symptomatic Twenty five of the patients died, a mortality of 62 per cent The epidemic was probably due to contamination of the drinking water

Surgery.

262. Intestinal Tuberculosis

L BÉRARD and J HEITZ (*Lyon Chir*, May–June, 1930, p 273) comment on the frequent occurrence of intestinal involvement in cases of pulmonary tuberculosis, and suggest that if diagnosed at an early stage the condition can be treated surgically with success The symptoms on which the diagnosis can be made are primarily gastric—loss of appetite, indigestion sometimes accompanied by vomiting, and pain in the epigastrium These symptoms, which are frequently reflex in origin do not respond to medical treatment, and by their persistence should lead to intestinal examination Intestinal symptoms follow with varying rapidity, and consist of constipation alternating with attacks of diarrhoea pain usually in the right iliac fossa a feeling of heaviness distension of the abdomen and tenderness on pressure Intestinal haemorrhage irregular pyrexia, and a lowering of the general condition are further indications that intestinal tuberculosis has developed Radiological examination is the best means of verifying this diagnosis, and should always be employed Therapeutic methods must be tried when the patients are not fit for operation but in every other case surgical treatment is of much greater value This may consist of a radical operation such as resection of the bowel, which is the operation of choice, or a palliative procedure such as a simple laparotomy which sometimes gives surprisingly good results an entero-anastomosis, unilateral or bilateral exclusion or the establishment of an artificial anus in the caecum In all cases of intestinal tuberculosis if the lesion is diagnosed and operative treatment is undertaken at an early stage the prognosis is said to be less grave than in former years, and good results are frequently obtained

263. Carcinoma of the Duodenum

J E SCHOFIELD (*Brit Journ of Surg* July 1930 p 87) describes carcinoma of the duodenum as an extremely rare condition, rather more common in the duodenum than in any other part of the small intestine The greatest number of duodenal cancers occur in the ampullary region and tend to encircle or extend along the intestine Various causes are suggested one being that the condition arises in aberrant stomach glands another that the primary site is in pancreatic rests a third that the cancer originates in Brunner s glands It has not been proved conclusively that duodenal ulcer is a predisposing cause of duodenal cancer Symptoms of growth in the supra ampullary region resemble those of pyloric cancer If the growth is in the ampullary region the symptoms are usually severe and jaundice with enlargement of the liver and gall bladder appears at an early stage.

Vomiting is usually present and wasting occurs owing to the obstructed flow of the pancreatic juice In cases of cancer in the infra ampullary region the early symptoms are nausea and indigestion with much vomiting of bile, rapid emaciation follows, also dilatation of the stomach and duodenum near the growth Treatment varies according to the site, size, and fixity of the growth Supra ampullary cancer is treated in the same way as pyloric cancer Ampullary cancer may be treated by palliative operations such as cholecystostomy, or anastomosis of the gall bladder to the stomach or first part of the duodenum, or by radical treatment such as the excision of the growth or the resection of the duodenum The mortality from this severe treatment is so high that palliative treatment, although offering only temporary relief, is held to be preferable Cases of infra ampullary cancer are best treated by resection A case is reported in which cholecystoduodenostomy and posterior gastro enterostomy were performed, the patient making a good recovery Six weeks later a further operation was carried out to implant radon seeds round the growth, but a duodenal fistula developed and the patient died It is suggested that had radium been available at the first operation the chance of success would have been considerably greater

264 Post-operative and Experimental Tetany.

A. CHRIST (*Deut Zeit f Chir*, July, 1930, p 34) reports a number of cases of post operative tetany in human subjects and a series of experiments on dogs, he concludes that the symptoms mainly due to defect or extirpation of the parathyroids may appear after various disturbances of the endocrine system Thus tetany may follow total extirpation of the thyroids may also occur after partial extirpation of the parathyroids when the thyroid is not functioning normally, though this "athyrosis" is not identical with hypothyroidism and cannot be gauged by basal metabolism estimations Tetany is a general toxicosis associated with the presence of pathological products of metabolism in the blood (derivatives of guanidin, etc) which interfere with calcium metabolism, the reduction in blood calcium being directly proportional to the severity of the tetany As a result of his animal experiments the author recommends the administration of standardized solutions of irradiated ergosterin (vitamin D) to human subjects in addition to glandular extracts and calcium Acute cases should be vigorously treated with calcium A milk and vegetarian diet is advised, and the consumption of meat should be limited, treatment by parathyroid grafts was found useless The author insists that it is as important to control the blood calcium content periodically in a case of tetany as it is to estimate the basal metabolism and the blood sugar content in Graves's disease and diabetes respectively

265 Orthopaedic Treatment of Little's Syndrome.

FROM an orthopaedic point of view L MICHEL (*Lyon Méd*, August 10th, 1930, p 161) defines the syndrome of Little as a spastic state, sometimes localized but always predominant in the lower limbs, and consisting of two elements—namely, a static or muscular contracture which causes articular stiffness and abnormal attitudes, and a dynamic or voluntary motor disturbance This disturbance results in the child being unable to contract the proper muscles alone, but at the same time has to contract the antagonists, so that the desired movement is executed only after a struggle between the various muscle groups, either slowly or abruptly and jerkily Michel maintains that, as regards treatment, no one method should be employed to the exclusion of others, and that after an operation, which should be performed at the proper time and should realize the mechanical conditions necessary for an upright posture and walking, a prolonged course of functional training should be instituted This treatment, which at its commencement should be given at a hospital or clinic, consists in a prolonged rest in the correct decubitus, daily hot baths, a prudent, passive movement of the joints, and instruction in executing, at first voluntarily and then automatically, isolated or co ordinated muscular contractions This training comprises three stages The first, which usually takes some days, proceeds slowly from simple to complex efforts In the dorsal decubitus the child should alternately flex and extend each lower limb, then, supported under the arms, it should maintain the most correct upright position possible and practise walking movements The second stage, which is of longer duration, consists in walking with artificial supports Two appliances, designed by Michel, are described In the third stage, when the child may return home, free walking with the aid of two canes is permitted During this stage daily exercises as prescribed should be continued The author emphasizes the long duration of the treatment, which is a matter of years and recommends that during its course the child should go home for occasional short periods for its psychical development

Therapeutics.

266 Gold Salts in Lupus Erythematosus

H HAXTHAUSEN (*Arch Derm and Syph*, July, 1930, p 77) records his experience over a period of two years in the treatment of lupus erythematosus by intravenous injections of gold chloride in over 100 patients Favourable results had previously been obtained with complex gold compounds, these suggested the possibility of their being the result of a "metal salt effect," and led the author to investigate the theory by using intravenous injections of gold chloride Injections of 1 c cm of a 0 1 per cent solution (representing 1 mg of gold chloride) were given once a week If no effect was produced by several injections the dose was increased to 5 c cm of the same solution (5 mg), and, if this failed, the dose was increased to 10 c cm (10 mg) Cure or decided improvement ensued in so many patients that the results appeared to be fully equal to those obtained with the complex gold compounds, and it was found that the most favourable results followed weekly injections of rather small doses Still better results were obtained when the method was combined with Finsen light or carbonic acid freezing Treatment with the complex gold compounds has been accompanied at times by annoying sequels or even serious effects, but with gold chloride there were no dangerous or even alarming results, and since this salt appears to have at least an equal therapeutic effect its use is preferable The 0 1 per cent solution is strongly bactericidal, and does not require sterilizing, it has the advantages of being easily prepared, and of being much cheaper than the complex compounds such as potassium gold cyanide and sodium aurothiosulphate

267 Xylene Treatment of Pediculosis

O FERGUSON (*Journ Amer Med Assoc*, April 12th, 1930, p 1134) recommends the routine employment of xylene ointment in pediculosis He finds that a large number of merchant seamen examined at Lillis Island suffer from this disease—*Pediculus pubis* is the chief offender, it is less noticeable than *P corporis* and is less irritating Seamen are often covered with these parasites from the eyebrows to the ankles, but most ships are supplied with tincture of larkspur and mercury ointments, which are efficient if used intelligently The tincture, however, evaporates too quickly in the hands of the average seaman, and mercurial ointment is preferable, but it causes dermatitis in many cases, while prolonged use by ignorant patients may cause mercurialism. Since, moreover, the cost of these preparations is a considera tion to the authorities concerned, Ferguson recommends the employment of xylene (25 per cent) in a base of equal parts of adeps lanae hydros and paraffin molle because it is effectual and cheap If applied undiluted, xylene is too irritating to the skin, mixed as directed it produces for a few minutes a mild warmth and a tingling sensation This is relieved by rubbing which distributes the ointment around the hair bases Patients are instructed to apply the ointment from the axillae to the ankles twice daily for at least five days This is necessary to ensure destruction of the hatching nits, which process continues for four to seven days

268 Balneotherapy in Salvarsan Collapse.

F WIRZ (*Münch med Woch*, July 18th, 1930, p 1225) describes the sudden alarming crises which occasionally occur during or after an injection of salvarsan The symptoms are similar to those of wound shock or anaphylaxis, and commence with flushing of the face and a feeling of heat, followed by pallor, sickness, cold skin, and cyanosis Usually the colour returns and the patient rapidly recovers, but the condition may progress to the stage of collapse when the blood pressure falls, the pulse becomes almost imperceptible, respiration is shallow and irregular, and consciousness may be lost At post mortem examination in fatal cases the heart and peripheral vessels are found to be relatively empty, the blood having collected in the splanchnic area The treatment of severe cases is very unsatisfactory, since adrenaline, ephetonin, and similar remedies remain unabsorbed at the site of injection owing to circulatory failure Acting on the well known fact that heat causes an increased flow through the peripheral arteries and arterioles, the author has treated several severe cases by immersing the unconscious patient in a bath so hot as almost to burn the hand The effect is described as rapid and striking the colour returns and consciousness is regained in a few minutes Recovery is so complete that the patient is usually allowed to return home within an hour or two of the onset of the symptoms The author suggests that the method may also prove useful in cases of collapse due to other causes

Ophthalmology.

269 **Diathermy in Diseases of the Eye**

P FIGNOR (*Brit Journ of Ophthalmol*, August 1930, p 405) describes his experience of the use of the alternating current of high periodicity in treating ocular diseases and painful eyes The current heats up the tissues of the orbit uniformly thereby inducing hyperæmia of that region, which together with the heat generated by the resistance of the tissues accounts for the therapeutic value of this procedure A glass eye cup with a hollow stem having a rubber rim where it fits into the orbit and pierced by an electrode is sterilized dried and placed in position by the operator Warm sterile normal saline solution is then poured in through the hollow stem The patient grasps in his right hand the other pole which is in the form of a handle and is warned not to relax his hold or a burn may result The operator must take care that during the treatment (usually lasting from four to six minutes, according to the sensations of the patient) there is no movement of the eye electrode or leakage from it While the current is passing the operator must watch the electrode closely, and be prepared to switch it off if the patient moves The patient is instructed to report if the eye becomes too hot making no movement of his head in doing so for fear of a burn Two applications weekly are generally given the amount of current ranging from 350 to 600 milliamperes though few patients are able to stand a higher dose than 500 No special protection for the eye is needed after the treatment Ocular conditions usually respond well to a few applications but the treatment may be continued for over a year without any evil consequences to the patients The author asserts that pain in the eye from whatever cause can always be relieved The types of cases that have given good results are glaucoma, chronic senile conjunctivitis episcleritis, chronic blepharitis, and gonococcal conjunctivitis

270. **Acute Ocular Pemphigus.**

ACCORDING to W O MARTIN jun (*Arch of Ophthalmol*, June, 1930 p 744), true pemphigus of the conjunctiva may exist and be associated with a similar condition in other parts of the body It may occur in an acute fulminating form, as in a case which he reports or in a chronic form The site of predilection is the lower half of the ocular conjunctiva and the inner angle of the lids As the shrinkage continues symblepharon develops Chronic pemphigus runs a long course with cycles of attacks and sometimes remissions Martin remarks that pemphigus is a rare disease attacking patients of all ages and sexes, and is not hereditary Its etiology is obscure, and not one certain causative factor is known There is no definite cause or duration of the disease and the prognosis is uncertain The subjective symptoms are not characteristic but consist usually of soreness tenderness burning, and itching with diffuse discharge The involved areas are rapidly converted into cicatrices with excessive contraction The conjunctiva shrinks becomes white and tense and the folds disappear Bands form which extend from the globe to the lids giving rise to varying degrees of symblepharon The lacrymal ducts may be occluded and the conjunctiva becomes dry, often with resulting total symblepharon The cornea is involved by extension of the conjunctival process Ulceration and suppurative keratitis may be found early in the disease Treatment is of no avail and is purely symptomatic Arsenic arsphenamine and neoarsphenamine radium x rays and high frequency currents have been tried but have proved ineffectual The pathology of the condition is obscure

271 **Traumatic Rupture of the Choroid.**

A J BEDELL (*Amer Journ of Ophthalmol* May 1930 p 390) describes a case of traumatic rupture of the choroid with detachment of the retina and spontaneous reattachment in a man aged 23 who was struck in the left eye by the closed fist He did not lose consciousness although he was badly mauled Three and a half days after the accident he complained that the vision was blurred The right side of the face and the right eye were normal the vision was 20/20 and the pupil was 3 mm in size regular and active as regards its movements The left side of the face showed a very extensive ecchymosis extending from the eyebrow to the angle of the mouth The left eye had vision of 20/70 and the 4 mm pupil responded slowly to light stimulus There were many dense floating clouds in the vitreous with a thick blood stained film in the lower portion of the fundus The blood in the vitreous began to be absorbed on the following day the oedema of the retina became less and concentric diverging rolls were noted in the retina There was a noticeable change in the vessels the arteries especially the superior nasal branches were contracted with an irregular calibre Three days afterwards there was more definite gray oedema of the entire fundus the haemorrhage in the lower portion of the vitreous was almost absorbed but the edge of the choroidal rupture was filled with blood Ten days after the accident the vision improved to 20/40 and four days later was 20/20 After four more days the most striking changes were in the level of the retina and included the decrease in the subretinal blood the restoration of the reflex in front of the macula and the increased whiteness of the nasal branch of the artery The central vision was 20/30 The various stages of healing are illustrated by photographs, and Bedell points out that the surgery of ocular injuries is of interest to almost all ophthalmologists especially since the war Many papers have been presented in relation to the diagnosis and treatment of intraocular foreign bodies but few have been devoted to the intraocular changes resulting from the impact of large non penetrating objects. Diagrams and charts have been prepared to convey the reporters impression of fundus changes but so far as the author is aware, there never appeared before in the literature the photographic life history of a traumatic detachment of the retina with a rupture of the choroid Probably stereoscopic photographs will materially assist ophthalmologists in drawing conclusions in relation to the time that has elapsed between the injury and certain residual conditions

Obstetrics and Gynaecology.

272. **Insulin Treatment of Menstrual Disorders.**

A. HOFMAN BANG (*Zentralbl f Gynæk*, May 17th, 1930 p 1223) found that in five patients with normal menses and pelvic organs the injection of insulin led to varied modifications of menstruation In eight out of nine amenorrhoeic patients, aged 22 to 2- who were given small doses of insulin for three to eight weeks menstruation returned in some cases it recurred without further treatment Coincident increases of weight and appetite were noted In a group of four patients with metrorrhagia and eleven with menorrhagia in all of whom gross uterine or ovarian disease was absent the injection of larger amounts (6–10 units) of insulin daily before or during menstruation had a favourable effect These observations were made in demented asylum patients who were instructed that the purpose of the injection was to increase the appetite The fact that insulin affected favourably both the amenorrhœa and excessive bleeding is ascribed to the action on the follicular and corpus luteum hormones respectively Vogt in three hundred cases of metropathia haemorrhagica has reported good results from insulin treatment, especially in patients at puberty and the climacteric

273 **The Capillary Resistance Test in Ovarian Insufficiency**

R SEYDEPHELM and M HEINEMANN (*Deut med Woch*, May 23rd 1930 p 860, state that though recent researches have thrown much light on the physiology of the ovarian hormone and made the standardization of dosage possible in ovarian therapy diagnosis and treatment have so far been based chiefly on the subjective symptoms of the patient Since the Rumpel Leede capillary resistance test has been found to be positive during menstruation and in certain phases of the men pause (when the ovarian hormone is present in the blood in minimal quantities) the authors have applied it in numerous cases of ovarian insufficiency The technique is simple The blood pressure armlet is inflated to 20 mm mercury above the diastolic pressure and is left on he arm for three to five minutes It is then released and the skin of the forearm and fold of the elbow is examined with a lens when minute cutaneous haemorrhages will be found if the reaction is positive There are many causes of a positive reaction such as infections and intoxications and (according to the authors) hyperacidity in gastric and duodenal ulcer diabetic acidosis chronic circulatory disease, scurvy and late rickets In cases where the positive reaction was presumed to be caused by ovarian insufficiency the oral administration of 100 200 and 300 mouse units of ovarian hormone on three successive days was followed by a negative reaction Ovarian treatment had no effect however on positive reactions due to non-ovarian factors More than 1 000 tests have been made and only 2 per cent of cases are apparent exceptions Thyroxine is apparently the only other hormone which will convert a positive reaction into a negative one, and the authors state that this accords with other evidence that the thyroid undertakes part of the ovarian function at the menopause A negative capillary resistance test is always found in early pregnancy—that is when the ovarian hormone is plentiful in the blood stream The authors consider that the lowered capillary resistance in ovarian insufficiency is related

to the vasomotor reactions, and to the occasional haemorrhages from skin and mucous membranes which occur during menstruation and the climacteric, the test, if carefully interpreted, is suggested as a useful objective control in ovarian therapy

274 Red Degeneration of Fibromyoma

M B CETRONI (*Ann Ostet e Ginecol*, May, 1930, p 423) records details of twelve cases of necrobiosis of uterine fibromyoma, and of six of angiomatous uterine fibromyoma He states that necrobiosis (red degeneration) in a myoma may be total or partial, giving rise to chiefly acute or chiefly chronic symptoms in the respective cases The symptoms consist in (1) pain, due partly to expulsive uterine contractions and partly to peritoneal irritation, (2) pyrexia, due in the absence of infection to toxic absorption, (3) increase in the size of the tumour, due to oedema, (4) metrorrhagia, and (5) amenorrhoea succeeding metrorrhagia Sufficient attention has not usually been paid to the last named symptom, which is allied to a general state of auto intoxication *Of 100 cases of necrobiotic myoma 80 are interstitial, 17 subserous, and 3 submucous, association with pregnancy is common Angiomatous and necrobiotic tumours* (the two varieties of "red myoma") constitute 3 4 and 7 4 per cent respectively of uterine fibromyomata, the symptoms of the former condition are
the acute symptoms of the latter
fibromyoma is found at operation there have been acute pain and pyrexia, if not removed surgically, an angiomatous fibromyoma usually becomes necrobiotic

275 Krukenberg Tumour following Plastic Linitis

F MERCKLN (*Bruxelles Med*, May 25th, 1930, p 818) reviews the literature and records the case of a woman aged 30 the mother of three children, who had suffered for six years from epigastric pain which had been particularly severe for the *last two months* A ray examination showed the presence of a dilated stomach with pyloric stenosis caused by a callous ulcer On laparotomy a large tumour was found situated at the pylorus Resection of the stomach according to the Billroth II method modified by Kronlein Mikulicz (gastrectomy enterostomy) was performed Examination of the specimen showed plastic linitis associated with an ulcer of the prepyloric portion of the stomach and an epithelioma Two and a half years later the patient developed signs of a tumour of the left ovary Laparotomy was performed, the growth removed showed the characteristic appearances of Krukenberg's tumour Death from multiple metastases ensued two years later There was no necropsy

Pathology.

276 Experimental Syphilis in the Mouse

A. BESSEMANS and F DE POTTER (*C R Soc de Biologie*, June 27th, 1930, p 818) have succeeded in producing macroscopic lesions of syphilis in the mouse Hitherto, though many workers have demonstrated the receptivity of the mouse to *Trep pallidum*, they have never been able to produce more than a so called inapparent infection—that is, one in which the spirochaetes multiply in the tissues without giving rise to macroscopical lesions or to clinical signs of illness The authors inoculated two white mice intravenously at the root of the tail with 0 5 c cm of a virulent suspension of *Trep pallidum*, from a testicular syphiloma of a rabbit Three months later one of the mice showed a cutaneous nodule, of pinhead size, situated in the inguinal region between the anus and the testicles This nodule progressively increased in size, and at the end of three weeks ulcerated, leaving a typically syphilitic chancre with indurated and slightly inflamed borders The lesion reached a size of 3 by 6 mm, remained stationary for several weeks, and then slowly retrogressed Spirochaetes were readily demonstrable in the lesion Material from this chancre was inoculated on to the scarified skin of the ano scrotal region of six fresh mice One of these mice after three weeks developed a small chancre containing spirochaetes, this lesion, however, healed completely in a fortnight *The authors* believe that the chancre in the first mouse resulted from infection of the skin at the site of intravenous inoculation

277 Transmission of Congenital Syphilis

P MULZER and C F HAHN (*Munch med Woch*, July 25th, 1930, p 1261) have shown by their experiments on mice and rabbits that the offspring of syphilitic mouse parents, experimentally infected with "Kolle rabbit virus" are congenitally syphilitic Injection of an emulsion of the internal organs of these young mice into the testicles of healthy rabbits, though producing no local syphilitic lesions, will, after an interval of several months, render these rabbits refractory to a subsequent dose of syphilitic virus, control rabbits not so treated give positive reactions The immediate offspring of a syphilitic female and a healthy male mouse were always congenitally syphilitic, in subsequent generations the results obtained were not so regular A male mouse infected with syphilitic material—a piece of rabbit testicular syphiloma *introduced under the skin of the back—can infect healthy* female mice with syphilis, the offspring have latent syphilis and are refractory to a subsequent inoculation with the virulent homologous virus The results of this infection are variable, the mother and the young may remain healthy, as tested by the inoculation of emulsions of the internal organs into the testicles of rabbits and the subsequent delayed reinfection of these rabbits, which will show no resistance, and presumably behave as healthy control rabbits

278 Effect of Carbon Dioxide on the Plasma

H J FUCHS (*Zeit f Immunitatsf*, July 11th, 1930, p 266) has studied the coagulability and the complementary power of blood plasma, with reference to the statement made by Lumiere and Grange that *venous blood coagulates* more rapidly and has a greater amount of complement than arterial blood Blood was withdrawn from the carotid artery of the rabbit by means of a paraffined glass cannula, and sodium oxalate was added, the blood was then centrifuged in paraffined tubes, and the clear plasma containing 1 per cent of oxalate was withdrawn Air or CO_2 was bubbled through the plasma and calcium chloride was added, the coagulation time being observed at 37°C The aerated plasma clotted in eight and a half minutes, and the CO_2 plasma in four minutes When air or CO_2 was bubbled through the plasma for a little over half an hour the aerated plasma clotted in eight and a half minutes as before, while the CO_2 plasma took eighteen minutes In the first experiment both specimens were weakly alkaline to litmus, in the second the aerated plasma was weakly alkaline, but the CO_2 plasma was slightly acid Similar observations were made on the complementary activity Compared with the control, plasma aerated for a short time was less active, and plasma treated with CO_2 was more active When aerated for a longer time the plasma showed again a diminished complementary activity compared with the control, while the CO plasma displayed even less activity than the aerated plasma It would therefore appear that increase in the CO_2 content of plasma, so long as the reaction remains weakly alkaline or neutral, increases its coagulability and its complementary activity Further increase, sufficient to render the reaction acid, decreases both functions The author considers that this may explain why in certain cases of suffocation the blood clots rapidly, while in others it clots more slowly

279 The Influence of Blood Groups in Malarial Transfusions

IN 1928 Farnell, while treating cases of general paralysis of the insane with injections of human blood containing malarial parasites, noticed that the period of incubation of malaria in the recipients varied, that in some instances a single injection of the blood failed to produce symptoms in the recipient, and that two patients receiving blood from the same donor at the same time often differed widely in the incubation periods of their malarial symptoms As a result of these findings, E M KNIGHTS (*Journ Lab and Clin Med*, July, 1930, p 980) has typed various donors of malarial blood and the recipient patients, and records the findings in twelve cases Early in the study it became evident that the question of blood groups was an important factor in determining the incubation period of the malaria The *Plasmodium vivax* of benign tertian malaria was used in the work, and it is an accepted theory that in man the only time that the parasite is found free from the erythrocytes is during that stage of schizogony when the merocyte ruptures and the merozoites migrate to fresh red cells *If*, due to an incompatibility of blood groups between the donor and recipient, agglutination and lysis of the donor's red cells occur, it is probable that only those parasites which are in the merozoite stage and ready to infest new cells may survive *If*, on the contrary, the donor and recipient are in the same group or in such relationship that the donor's erythrocytes are not agglutinated by the recipient's serum, *a minimum incubation period may be expected* Another factor influencing this period is the stage of the development of the parasite in the donor's blood at the time of the transfusion In cases of incompatibility with a short incubation period, it was often found that there was a predominance of full grown merocytes in the blood of the donor and that the merozoites liberated by red cell destruction due to incompatibility were ready to attack fresh erythrocytes regardless of blood group Hopf has come to similar conclusions in a study of eighty one cases in which blood groupings were made before transfusions of malarial blood

"Careful test has proved to me that there is no purer Ether on the world's market to-day than . HOWARDS'"

That the considered opinion of an eminent authority as quoted above is fully endorsed is shown by the fact that

HOWARDS' STANDARD ETHER

is in use in practically all the big Hospitals and Institutions throughout the country, including —

THE LONDON HOSPITAL	ST THOMAS S HOSPITAL
KING'S COLLEGE HOSPITAL	ROYAL WATERLOO HOSPITAL
UNIVERSITY COLLEGE HOSPITAL	GREAT ORMOND ST HOSPITAL
QUEEN MARY S HOSPITAL	ROYAL SUSSEX HOSPITAL
PADDINGTON INFIRMARY	OLDHAM ROYAL HOSPITAL
FREEMASONS HOSPITAL	STAFFORD GENERAL INFIRMARY

THE LATEST . . . .

7,000,000 COOK BY GAS

In Great Britain to-day nearly seven million people cook by gas. Could you wish for stronger evidence of its fitness for this purpose? These millions use gas because it gives them perfect cooking—with the greatest ease, the utmost economy. Any degree of heat they want—from simmering to grilling—is theirs at once. *And gas never fails.* Can you wonder that in the area of one gas undertaking alone over 10,000 new houses are now having gas laid on for cooking?

The newest homes use

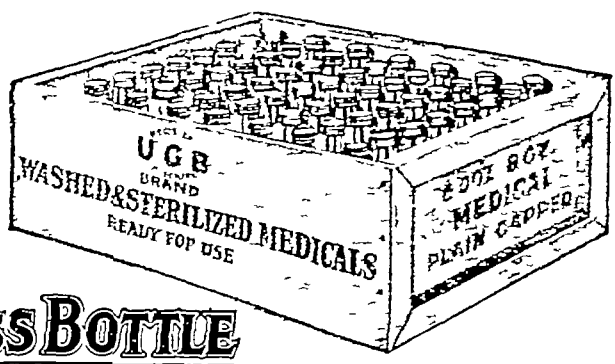
The UGB MEDICAL BOTTLE Service



Photograph of actual pack age of Cork-mouth bottles with cover removed.

THE UGB Washed and Sterilized medical bottle service—introduced early in 1929—has proved to be an unqualified success, so much so that we were recently compelled to increase the capacity of our washing and sterilizing plant.

The screw cap service is in particular demand, and owing to the preference of users for a cap in a neutral colour, we have now standardized in fitting the bottle with an attractive RUSTLESS WHITE ENAMELLED CAP.

Photograph of actual pack age of Screw - cap bottles with cover removed.

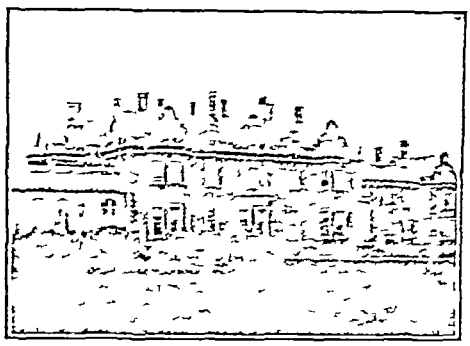
THE RESIDENTIAL TREATMENT OF ALCOHOLISM & DRUG ADDICTION

RENDLESHAM HALL

(Postal Address)—WOODBRIDGE, SUFFOLK



Rendlesham Hall which is open to receive patients is essentially a Sanatorium. Its daily life and routine is that of an ordinary comfortable holiday or health resort, or of a large country house. Each patient has all the privileges of a guest consistent with the prescribed medical treatment.

Rendlesham Hall has 45 bedrooms and about 450 acres of gardens and park. It has also a private nine-hole golf course, tennis and croquet lawns, and bowling green.

Illustrated booklet giving particulars as to terms etc. can be had on application to the
